Through Holes Push Chips

Spiral Point

LHSF

- Spiral point or LHSF (Left-Hand Spiral Flute).
- Ideal for materials with long chips.

Blind Holes Pull Chips

RHSF

- RHSF (Right-Hand Spiral Flute).
- Ideal for materials with long chips.

Blind or Through Holes Store Chips

STFL

- STFL (Straight Flute).
- Ideal for materials with short chips.

Blind or Through Holes No Chips

Forming Tap

- Forming.
- Ideal for ductile materials <32 HRC.

Unified Inch Screw Threads

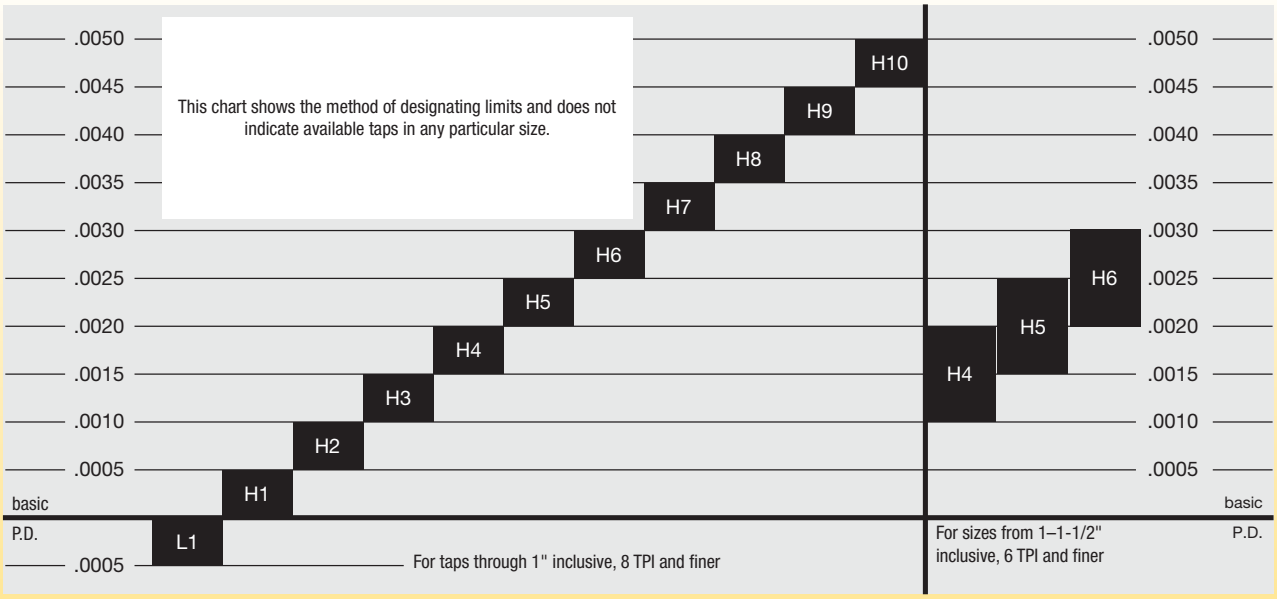
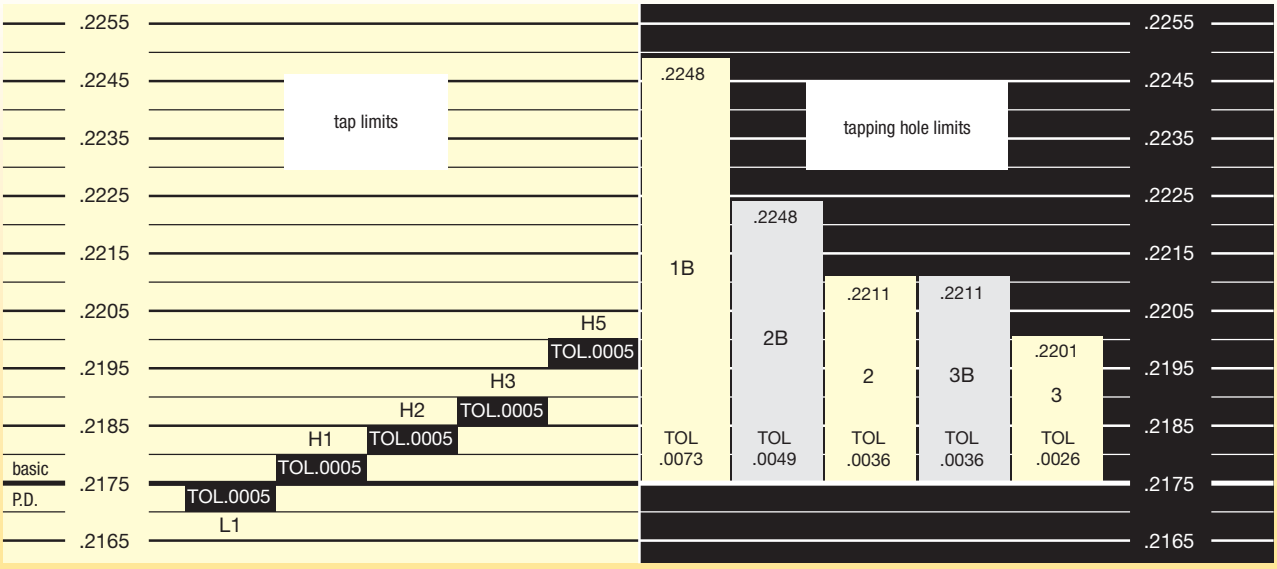
In addition to the nominal size and pitch of a tap, there is another important dimensional factor to be considered when selecting a ground thread tap for a given job. This factor is the pitch diameter tap limit, "H" and "L". "H" represents (high) above basic pitch diameter; "L" (low) is below basic pitch diameter. Tap limits have been established to provide a choice in the selection of the tap size best suited to produce the class of thread desired.

Figure 1 Illustrates the numbering system and the .0005" diameter increment separation between successive limits. Because the starting point is basic pitch diameter, dividing the limit number by two establishes, in thousandths of an inch, the amount the maximum tap pitch diameter is above basic in the "H" series and the amount the minimum tap pitch diameter is under basic in the "L" series.

Figure 2 Illustrates the positioning of the tap limits in relation to the various classes of threads for a 1/4–20 size.

Figure 1





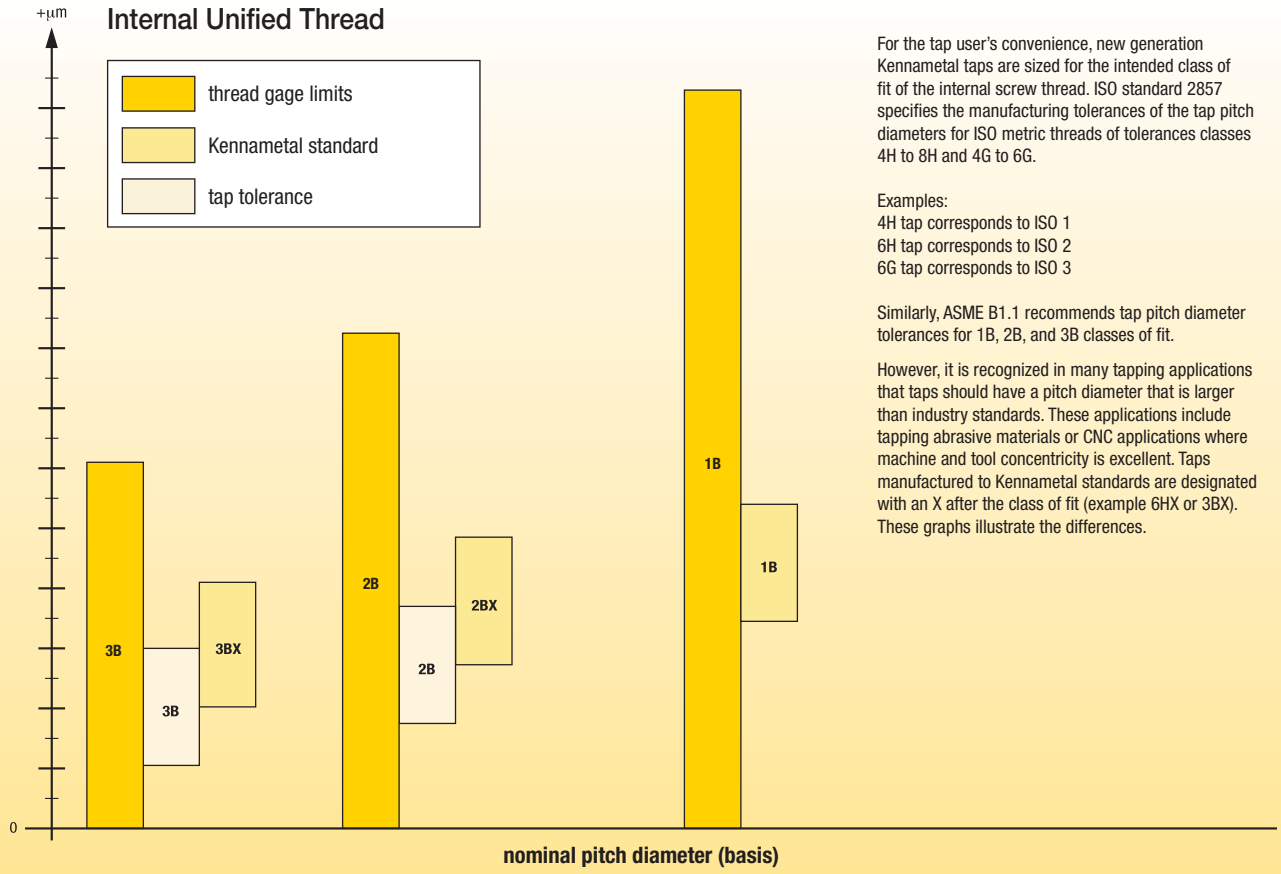


Figure 2

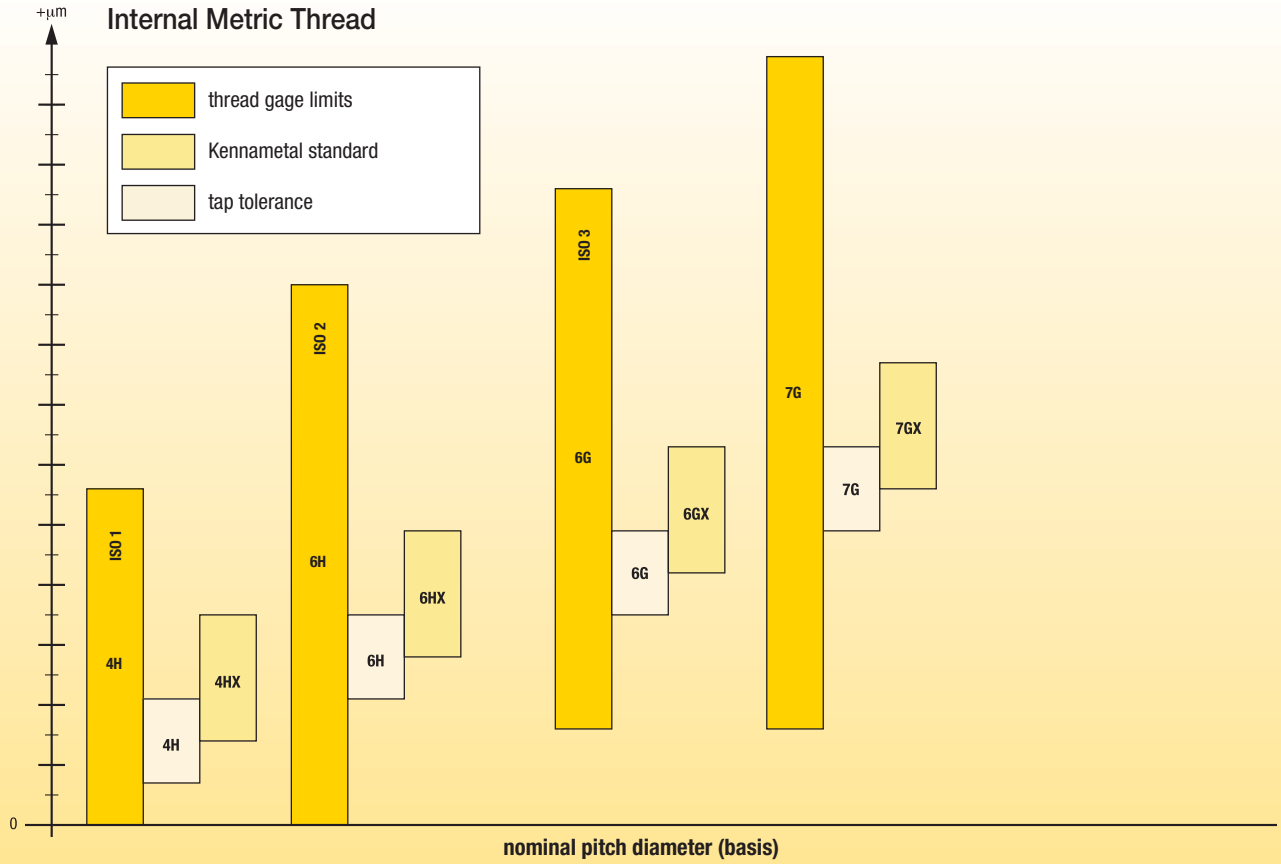
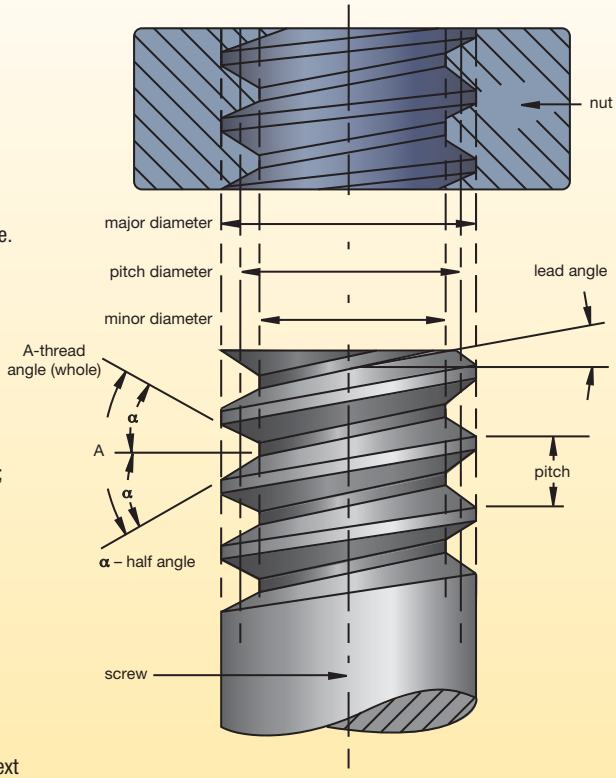
Class of Thread – 1/4–20 UNC and NC

Internal Unified Thread



For the tap user's convenience, new generation Kennametal taps are sized for the intended class of fit of the internal screw thread. ISO standard 2857 specifies the manufacturing tolerances of the tap pitch diameters for ISO metric threads of tolerances classes 4H to 8H and 4G to 6G.

Examples:
4H tap corresponds to ISO 1
6H tap corresponds to ISO 2
6G tap corresponds to ISO 3



Similarly, ASME B1.1 recommends tap pitch diameter tolerances for 1B, 2B, and 3B classes of fit.

However, it is recognized in many tapping applications that taps should have a pitch diameter that is larger than industry standards. These applications include tapping abrasive materials or CNC applications where machine and tool concentricity is excellent. Taps manufactured to Kennametal standards are designated with an X after the class of fit (example 6HX or 3BX). These graphs illustrate the differences.

Internal Metric Thread

It is generally recognized that, in mass production, it is impossible to reproduce in exact detail the theoretically perfect product as laid out on the drawing board. The allowed slight variation between the theoretically perfect product drawing and each unit of the actual product is called the tolerance.

Allowance

An intentional difference in correlated dimensions of mating parts. It is the minimum clearance or maximum interference between such parts.

Angle of Thread

The angle included between the flanks of the thread measured in an axial plane.

Half Angle of Thread

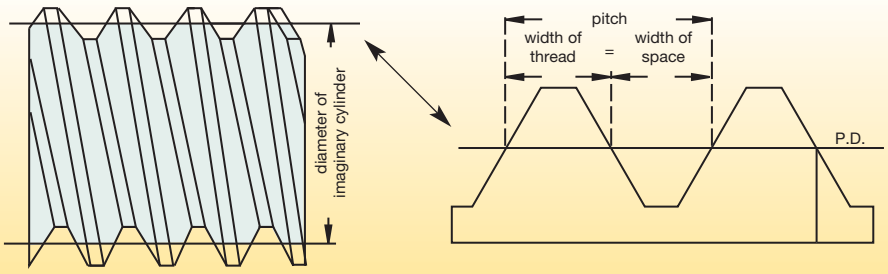
The angle included between a flank of the thread and the normal (90°) to the axis, measured in an axial plane.

Lead of Thread

The distance a screw thread advances axially in one turn. On a single-thread screw, the lead and pitch are identical. On a double thread, the lead is 2x pitch; on a triple thread, the lead is 3x pitch, etc.

Major Diameter

The largest diameter of a straight-screw thread.

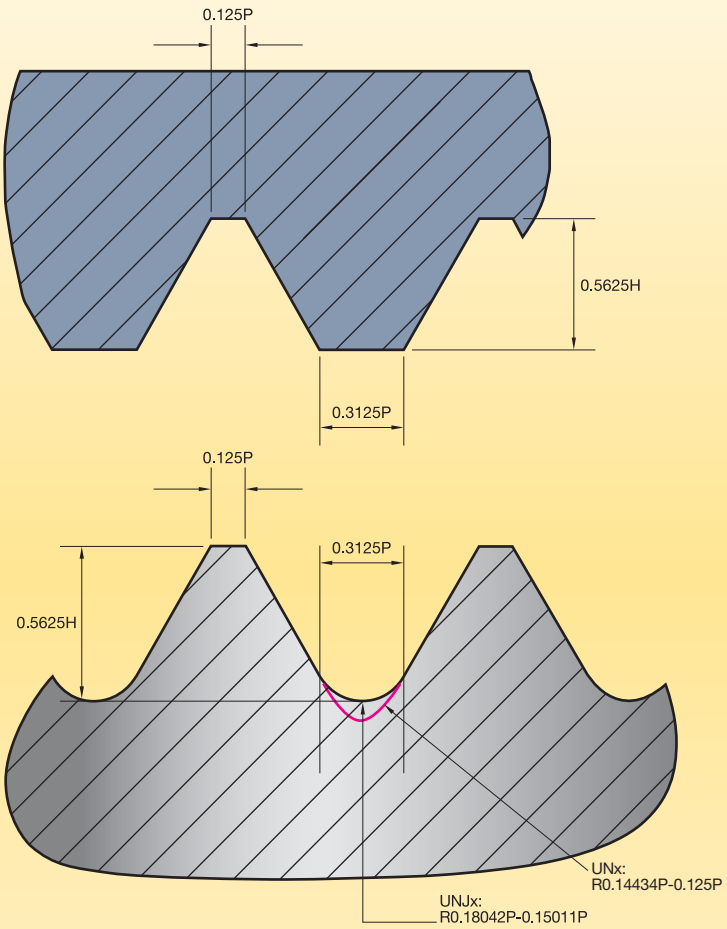


Minor Diameter

The smallest diameter of a straight-screw thread.

Pitch

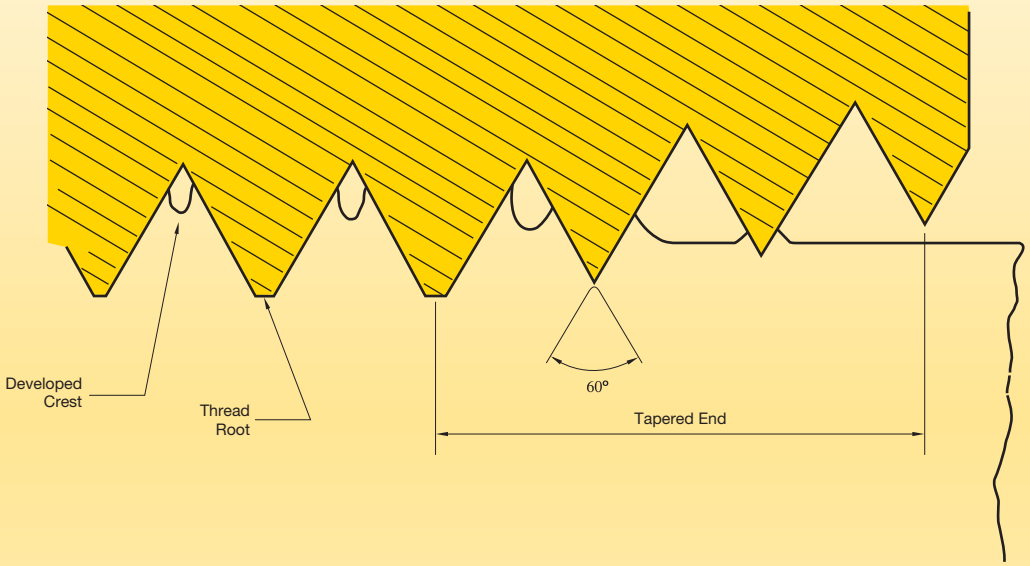
The distance from a point on a screw thread to a corresponding point on the next thread measured parallel to the axis.



The pitch in inches = $\frac{1}{\text{number of threads per inch}}$

Pitch Diameter

On a straight-screw thread, the diameter of an imaginary cylinder that would pass through the threads at such points as to make equal the width of the threads and the width of the spaces cut by the surface of the cylinder.



A thread system is available for aerospace and other applications where high fatigue strength is required. The UNJ thread form is defined by ASME B1.15 and is similar to Military Specification MIL-S-8879. Screw thread assemblies consist of external and internal threads. In order to minimize the stress on the external UNJ thread, a controlled root radius is required that is equal to 0.15011P to 0.18042P, where P is the thread pitch. Internal UNJ threads are not required to have a radius at either the major or minor diameters.

Because external UNJ threads must be produced with a defined root radius, standard UN tooling may not be used. However, internal UNF threads may be produced with ground thread UN taps sized to produce the proper class of fit. The tap does not need to be marked with a letter J. Attention must be paid to the tap drill since the minor diameter has to be specified so as to provide clearance with the root radius on the external thread.

For UNJ thread specifications, the reader is referred to ASME B1.15. Please note this standard includes Class 3 and Class 2 UNJ screw threads. However, only Class 3 UNJ threads meet the requirements of Military Specification MIL-S-8879. For Unified Inch (UN) thread specifications, refer to ASME B1.1.

Unlike cutting taps, which remove material, forming taps generate an internal screw thread by displacing material and forming it into the V-shaped thread. A common misconception is that a thread rolling action occurs. Instead, the threads are formed over the tapered entry section of the tap as the tap rotates into the hole. A succession of deeper penetrating lobes over the entry plastically displaces material radially between the tap's thread flanks until the entry length is reached. At this point, the thread is fully formed at the correct thread height.

Forming taps have numerous advantages over cutting taps. The most obvious advantage is that forming taps do not create chips. There are no chip removal problems. Bird nesting is a situation that occurs when chips wrap around the shank of spiral-fluted taps when tapping blind holes in long chipping materials. Forming taps help this to be avoided. Since forming taps avoid this problem, they are stronger and more resistant to breakage. Another misconception is that forming taps produce stronger threads. Although the forming process strain hardens the thread flanks, it has very little effect on the major diameter, the location where internal threads strip.

Forming taps can only be used in ductile materials. Due to increased friction relative to cutting, forming taps require higher torque than cutting taps. In some situations, oil-based lubrications are required, and this might not be convenient on CNC machining centers that use water soluble coolant. In this situation, the lubricant concentration should be increased.

Since forming taps displace material, larger diameter pre-tap holes are required. This is especially important when converting from cutting taps to forming taps. If a cutting tap hole size is used, the displaced material will over-fill the tap's threads and breakage will result. Please consult hole size charts for forming taps.

coating	properties and application	precautions
Titanium Nitride (TiN)	Proprietary TiN coating (hardness 2300 Vickers) offers significantly improved wear life and thread finish, often at higher tapping speeds, in a broad range of materials, especially steels, irons, and plastics. Golden color.	Use with caution in non-ferrous materials such as aluminum because of tendency to gall.
Titanium Carbonitride (TiCN)	Proprietary TiCN coating (hardness 3000 Vickers) is harder, tougher, and more wear resistant than TiN under conditions of moderate cutting temperatures. Like TiN, TiCN may be used at higher cutting speeds in a broad range of materials, especially steels and irons. Blue-gray color.	Use with caution in non-ferrous materials such as aluminum because of tendency to gall. TiAlN is a better choice when used at extreme temperatures.
Titanium Nitride + Chromium Carbide Carbon (TiN + CrC/C)	Proprietary coating (hardness 2300 Vickers) that combines the wear resistance of smooth TiN coating with a lubricous top layer of chromium carbide carbon. Effective in stainless steel and non-ferrous materials including aluminum and titanium. Ideal choice for 300 series stainless steels, wrought, and die cast aluminums. Black/gray color.	Effective in both ferrous and non-ferrous materials.
Titanium Aluminum Nitride (TiAlN)	Nanolayer TiAlN coating (hardness 3300 Vickers) offers improved wear life and thread finish, especially in conditions where high temperatures can be generated. Use for PH stainless steels and nickel-based alloys like INCONEL®. Violet/gray color.	Use with caution in non-ferrous materials because of tendency to gall.
Chromium Nitride (CrN)	CrN is medium hard (hardness 1800 Vickers) and has a lower wear resistance than TiN, TiCN, and TiAlN. However, unlike these coatings, CrN does not gall when used in some non-ferrous work materials. Use for brass, bronze, zinc alloys, and magnesium alloys. Silver color.	Ineffective in ferrous materials.
Nitride	Hardened case extends wear life in abrasive materials. Use for aluminum and other non-ferrous materials.	Avoid on taper pipe, fast spiral, and small diameter (<#6) or fine pitch taps due to tendency for thread chipping.
Oxide	Helps prevent galling in ferrous (iron-based) materials. For free machining steel. Use for steels, stainless steels, and irons.	Has a tendency to cause galling in non-ferrous materials such as aluminum.
Nitride and Oxide	Combines the benefits of nitride and oxide surface treatments. For steels, stainless steels, and nickel alloys.	See precautions for nitride and oxide surface treatments.

Factors when trying to determine the best tapping speeds:

- Material to be tapped
- Length of chamfer on tap
- Percentage of full thread to be cut
- Length of hole (depth of thread)
- Pitch of thread
- Cutting fluids
- Machine equipment
- Horizontal or vertical tapping

The best and most efficient operating speeds for taps cannot be calculated with the same certainty, as for many other metalcutting tools.

With other tools, the feed per revolution can be set at any desired point and can be varied as conditions demand. Taps, on the other hand, must always be advanced at a rate equal to one pitch for every revolution. The style of tap may vary the conditions.

For example, with a bottoming tap, the first thread on each land cuts the full height of thread, while, with a taper or starting tap, a number of threads do their share of the cutting before the full height of thread is reached.

The depth of thread also varies, depending on the pitch. The coarser the thread, the greater the advance of the tap per revolution and the greater the amount of material removed.

The method of feeding the tap, and the type of equipment for driving, also influences the permissible speeds. If taps are mechanically fed at the proper rate of advance, they can be operated at higher speeds than if they are required to feed themselves and pull some part of the machine along with them.

Speeds may be modified to take into account any or all of these factors:

- Speeds must be lowered as length of thread increases because, in deep thread holes, the accumulated chips increase friction and interfere with lubrication.
- Bottoming taps must be run slower than plug taps.
- Tapping full height of thread calls for slower speed than if the commercial 75% height only is required.
- Coarse-thread taps in the larger diameters should be run more slowly than fine-thread taps of the same diameters.
- The quantity and quality of cutting fluid may affect the permissible speeds as much as 100%.
- Taper threaded taps, such as pipe taps, should be operated from 1/2–3/4 the speed of a straight thread tap of comparable major diameter.

RPM Formulas

SFM = Surface Feet per Minute
RPM = Revolutions per Minute
IPM = Inches per Minute
TPI = Threads per Inch

S m/min = Surface Meters per Minute
$\pi = 3.1416$
mm/min = millimeters per minute
P = Pitch (1/number of threads per inch)

Inch Sizes

SFM	=	$\frac{\text{RPM x tool diameter}}{3.82}$	or	0.26 x RPM x tool diameter
RPM	=	$\frac{3.82 \text{ x SFM}}{\text{tool diameter}}$		
IPM	=	$\frac{\text{RPM}}{\text{TPI*}}$	or	*P x RPM

Metric Sizes

S m/min	=	$\frac{\pi \text{ x tool diameter x RPM}}{1000}$
RPM	=	$\frac{\text{mm/min x 1000}}{\pi \text{ x tool diameter}}$
mm/min	=	mm P x RPM

UNC/UNF and NPT/NPTF

Partial List of Solutions to Tapping Problems

application	symptom	common cause	remedy
general	gage out of limits	tap size and gage mismatch	select tap size for gage
	oversize thread	alignment, spindle feed	correct
	oversize at top	runout or alignment	correct
	go gage binds part way	worn tool, tap cuts off lead	replace tap, synchronous holder
	thread shaving	feed error, high axial force	program, synchronous holder
	chipping	high cutting force, worn tap	tap geometry, replace tap
	breakage	chip jamming flutes	tap geometry, tapping depth
	–	worn tool, high torque	replace tap with new tool
	short life, low speed	excessive wear	SC or HSS-E-PM HP taps
steel	birdnest blind hole	long, ductile chips	T630 KP6505 (oxide), peck feed
	chipping	high material hardness	T600, T602 KSP21 (TiN)
	breakage in blind holes	hole depth >2D, chip jamming	T604 KHS26 (TiN/MoS_2)
stainless steel	oversize thread, low life	galling	T620, T630 KM6515 (TiN-CrC/C)
	short life	work hardened core hole	replace drill
cast iron	excessive wear	abrasion	T640 KP6525 (TiCN)
aluminum, cast	excessive wear	high silicon	T640 KP6525 (TiCN)
aluminum, wrought	oversize thread	galling	T672, T682, T686 KSMN34 (TiN-CrC/C)
nickel, cobalt alloys	short life	high cutting temperature	T690, T692, T694 KSP27 (AlCrTiN)
titanium	short life	high cutting temperature	T660, T662 KSSM24 (TiN-CrC/C)

Tap Custom-Order Worksheet

Use this Custom-Order Worksheet to modify an existing product to meet your specifications. If your custom requirements do not fall into these categories, simply contact your Kennametal Distributor.

Trust our experienced distributors and Kennametal engineering team to design the best solution for you.

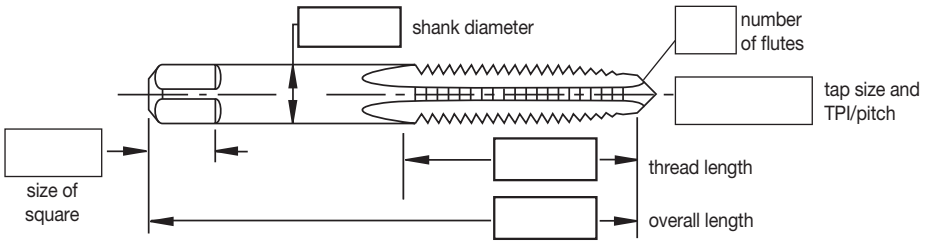
1. Start with the standard product most similar to your specifications:

catalog number _____ **grade/coating** _____

2. Type of tap needed:

❑ solid carbide ❑ high-performance HSS ❑ general purpose ❑ spiral point

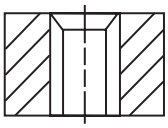
❑ hand ❑ forming ❑ spiral flute



_____ pipe (and style) _____ other

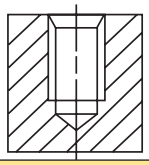
3. Direction of cut (circle one)**:** left hand right hand

4. Material overview:



❑ ANSI ❑ DIN ❑ JIS ❑ other

5. Desired dimension:



6. Choose one:

through hole:
hole diameter _____
hole depth _____

blind hole:
hole diameter _____
hole depth _____

7. Chamfer:

❑ taper: 7–10 pitch ❑ plug: 3–5 pitch ❑ semi-bottom: 2–3 pitch ❑ bottom: 1–2 pitch

8. Class of fit: **H limit** _____ **metric D limit** _____ **diameter pitch limit** _____

9. Workpiece material: _____

10. Hardness: _____

11. Number of taps required: _____

12. Price

Contact your Authorized Kennametal Distributor partners.

13. Other comments or special characteristics:

customer company name	**date**
address	**phone number**
city, state, zip	**fax number**
customer contact	**customer email address**

High-Performance Multipurpose HSS-E GOtap™

GOtap is the solution for high-performance multipurpose tapping. GOtap includes optimized flute geometries and PVD coatings capable of tapping a broad assortment of ductile materials, such as stainless steels, carbon and alloy steels, cast aluminum, and ductile iron. The unmatched versatility of GOtap means lower inventory costs with no loss of productivity, consistent tool life, and high-quality thread finish.

ADVANCED TECHNOLOGY

- Manufactured with high-vanadium HSS-E material for exceptional wear characteristics and longer tool life.
- Optimized geometries for efficient chip evacuation in both through and blind holes.
- Advanced PVD coatings to reduce tapping torque resulting in high-quality thread finish and longer tool life.

Experience the advantages at your Authorized Kennametal Distributor or at **kennametal.com**.

Grades

Coating	Grade Description	wear resistance ⟷ toughness: 05	10	15	20	25	30	35	40	45
K600	Carbide grade made from high-quality, micrograin materials for cutting all types of workpiece materials. Very high toughness ensures a controlled wear rate. The micrograin structure enables extremely sharp cutting edges.									
KCPM15	Coated carbide grade with thick PVD coating and optimized chemistry and process for increased wear resistance. Outstanding protection in milling stainless steel to mitigate crater, DOCN (depth-of-cut notching), and flank wear. Excellent performance up to 52 HRC.									
KC643M	Coated fine-grain grade with PVD multilayer (AlTiN). KC643M™ is a very thin and hard PVD coating particularly suited for cutting steel, cast iron, stainless steel (wet), and titanium (wet). This grade can be used for materials with hardness up to 52 HRC.									
KC639M	PVD- (AlTiN) coated carbide on a submicron carbide substrate. This hard coating provides outstanding performance in milling hardened materials (58–65 HRC).									
KCSM15	Coated carbide grade with thick PVD coating and optimized chemistry and process for increased wear resistance. Outstanding protection in milling stainless steel to mitigate crater, DOCN (depth-of-cut notching), and flank wear. Excellent performance up to 52 HRC.

CONTACT US

Our customers are important to us. We want to provide you the best customer service in the industry. If you have a comment or question, please send it to us. We strive to respond to all inquiries within 24 hours.

FIND A LOCAL AUTHORIZED DISTRIBUTOR IN YOUR AREA

Kennametal offers world-class products and services globally. Our distributors know us, and more importantly, they know you. They know better than anyone in the industry how to put the global power of Kennametal to work for you — in your industry, in your region, and for your business.

DUO-λOCK® HARVI™

Primary Application

HARVI geometries for Duo-Lock™ target applications where solid carbide end mills are currently used. The Duo-Lock™ system combines the highest runout accuracy and length repeatability with maximum coupling stability. This enables the Duo-Lock™ system to use the full potential of Kennametal cutting geometries and grades with the flexibility of a modular system. Significant metal removal rates can be achieved. A wide range of diameters and corner configurations, such as chamfer, radii, and sharp edges, are available from stock.

- Cutting data and tool life comparable to high-performance solid carbide.
- Proprietary HARVI geometries enable roughing and finishing with one tool.
- 1.5 x D standard cutting edge length enables fewer passes.
- Up to 1 x D full slotting increases metal removal rates, increasing productivity significantly.
- Extensive offering of straight and conical shank tools, and integral adapters that include DV, BT, and HSK.

Features and Benefits

Advanced Technology

- New asymmetrical HARVI 4-flute geometry for higher feed-per-tooth rates.
- Variable helix design for chatter-free machining at high feed rates.
- Less pressure on cutting edge through tailored axial and radial rake angles.
- Eccentric relief design increases tool life through higher edge stability.
- Proprietary tapered core for highest tool stability when roughing and finishing.

Tailored Grades

- KCSM15™ Beyond™ grade for exceptional tool life in titanium and stainless steels.
- KCPM15™ Beyond grade for outstanding wear protection in stainless steel to mitigate cratering, depth-of-cut notching, and flank wear.
- Universal KC643M™ grade for cutting steel, cast iron, stainless steel (wet), and titanium (wet).

Customization

- Intermediate diameters are available between 3/8–1 1/4".
- Chip divider geometry helps reduce power usage and improve chip formation in difficult-to-cut materials.
- Engineered solutions including shank and non-standard length versions available.
- Custom solutions within standard blank dimension are available.

Extensive Standard Offering

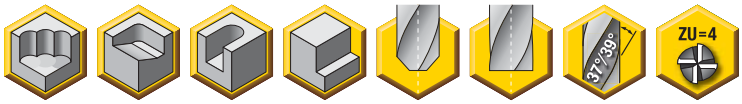
- Diameter ranges 3/8–1 1/4".
- Necked, corner radii, chamfer, and square-end tips available.
- Integral adapters to reduce interface for maximum accuracy.
- Steel extensions with Safe-Lock™ by HAIMER shanks to prevent pullout.
- Cut-to-size extra-long extensions available upon request off the shelf.

High-performance modular solid carbide end mills.

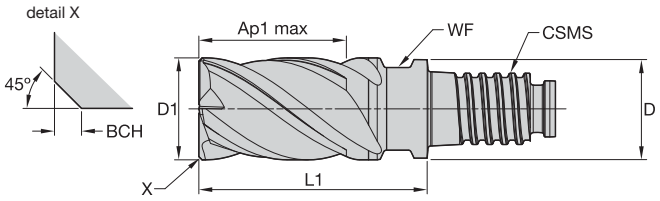
Intelligent Thread
Ensures that stress levels remain below critical values.

High-Performance Geometries
Highest metal removal rates with up to 1 x D full slotting and up to 1.5 x D side milling at 50% ae capability.

3rd Contact Surface
Delivers high stiffness and highest accuracy below .0002" runout.



DUO-LOCK®
by HAIMER® and Kennametal



Unequal Flute Spacing
Reduces vibrations. Improves surface finish.

Double Cone
Eliminates expensive presetting processes by providing an axial .0004" repeatability.

37°/ 39° Variable Helix Technology
Minimizes chatter and harmonics for smoother machining.

- Asymmetrical flute spacing and variable helix configuration minimize chatter and harmonics for smoother machining.
- Center cutting.
- Single tool for both roughing and finishing, reducing setups.
- Standard items listed. Additional styles and coatings made-to-order.

NOTE: Those guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. Please adjust parameters according to system stability.
For side milling with ap larger than 1 x D, reduce fz by 20%!
Cylindrical shanks not recommended for full slotting.

NOTE: Those guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. Please adjust parameters according to system stability.
For side milling with ap larger than 1 x D, reduce fz by 20%!
Cylindrical shanks not recommended for full slotting.

- Unequal flute spacing and variable helix configuration minimize chatter and harmonics for smoother machining.
- Non-center cutting.
- Ramping up to 3°.
- Five-flute geometry able to slot up to 1 x D.
- Single tool for both roughing and finishing, reducing setups.
- Standard items listed. Additional styles and coatings made-to-order.

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. Please adjust parameters according to system stability.
For side milling with ap larger than 1 x D, reduce fz by 20%!
Cylindrical shanks not recommended for full slotting.

Duo-Lock™ HARVI™ III

CHALLENGE

- Facing steel (1215) material.
- External emulsion.
- Current solution solid carbide.

SOLUTION

- Duo-Lock Ø 5/8".
- HARVI III UJDV.
- Corner radius R = .015".

CUTTING DATA

- v_c 699 SFM
- f_z .0020 IPT
- a_p .050"
- a_e .472"

RESULT

- 40% higher feed per tooth.
- 15% increase in cutting speed.
- Good surface finish and minimum wear on edges.

BENEFIT

- Reduced machining time.
- Increased productivity.
- Reduced tooling cost.

Duo-Lock™ HARVI

CHALLENGE

- Roughing of sensor mounting slot in cast iron.
- External emulsion.
- Current solution solid carbide.

SOLUTION

- Duo-Lock Ø .630" — cylindrical shank.
- HARVI UKDV.
- Corner radius R = .020".

CUTTING DATA

- v_c 190 SFM
- f_z .0026
- a_p .863"
- a_e .314"

RESULT

- Less wear.
- More stable process.

BENEFIT

- No unpredictable breakage like with competitive solid carbide tool.
- Stable machining process.

Duo-Lock™ HARVI™ III

CHALLENGE

- Finishing contour milling with lightly interrupted cut.
- Blade machining of X20Cr and X22Cr (M3).
- External emulsion.
- Current solution solid carbide.

SOLUTION

- Duo-Lock Ø .630" — cylindrical shank.
- HydroForce™ with reducer sleeve.
- HARVI III UJDV geometry in KCSM15™.
- Corner radius R = .157".

CUTTING DATA

- v_c 1148 SFM
- f_z .0047 IPT
- a_p .020"
- a_e .157"

RESULT

- Tool life increased from 34 to 103 parts.
- Machining time per part reduced by 50%.

BENEFIT

- Increase of productivity.
- Cost reduction through almost triple tool life.
- Improved surface finish.

Duo-Lock™ HARVI III

CHALLENGE

- Hard machining — side milling.
- Hardened steel (17–4 PH) — 35 HRC.
- External emulsion.
- Current solution solid carbide.

SOLUTION

- Duo-Lock Ø 5/8".
- HARVI III UJDV.
- Corner radius R = .015".

CUTTING DATA

- v_c 736 SFM
- f_z .0044 IPT
- a_p .600"
- a_e .030"

RESULT

- 15% increase in cutting speed.
- Good surface finish and minimum wear on edges.

BENEFIT

- Reduced machining time.
- Increased productivity.
- Reduced tooling cost.

CFRP Machining Tooling

KCN05™

Engineered for machining difficult CFRP (Carbon-Fiber Reinforced Polymer) and non-ferrous components. KCN05 solid carbide tooling provides excellent tool life and produces smooth finishes with improved edge quality.

- Excellent tool life due to KCN05 diamond-film coating.
- Proprietary substrate improves coating adhesion to extend tool life.
- Design minimizes delamination and bur formation.
- Compression-style end mills for trimming operations.
- Left-hand down cut and ball nose cutters for machining cavities.
- Bur-style router for highest Metal Removal Rates (MRR).

DUO-λOCK® MaxiMet™

High-Performance Modular Solid Carbide End Mills

Primary Application

The MaxiMet system provides extraordinary metal removal rates by combining roughing and finishing operations with any aluminum plunging, slotting, and profiling application. Its proprietary flute geometry is designed for high stiffness and improved chip evacuation to generate exceptional wall-to-floor perpendicularity, even in thin-wall applications. To ensure a superior floor surface finish, the MaxiMet front geometry is equipped with a wiper facet grind.

- Only one tool needed for roughing and finishing operations.
- Slotting depths up to 1 x D and side milling up to 0.5 x D radial and 1.5 x D axial engagement.
- Unequal flute spacing for chatter-free performance with 3-flute series.
- Multiple corner radii and extended neck configurations available as standard.

Features and Benefits

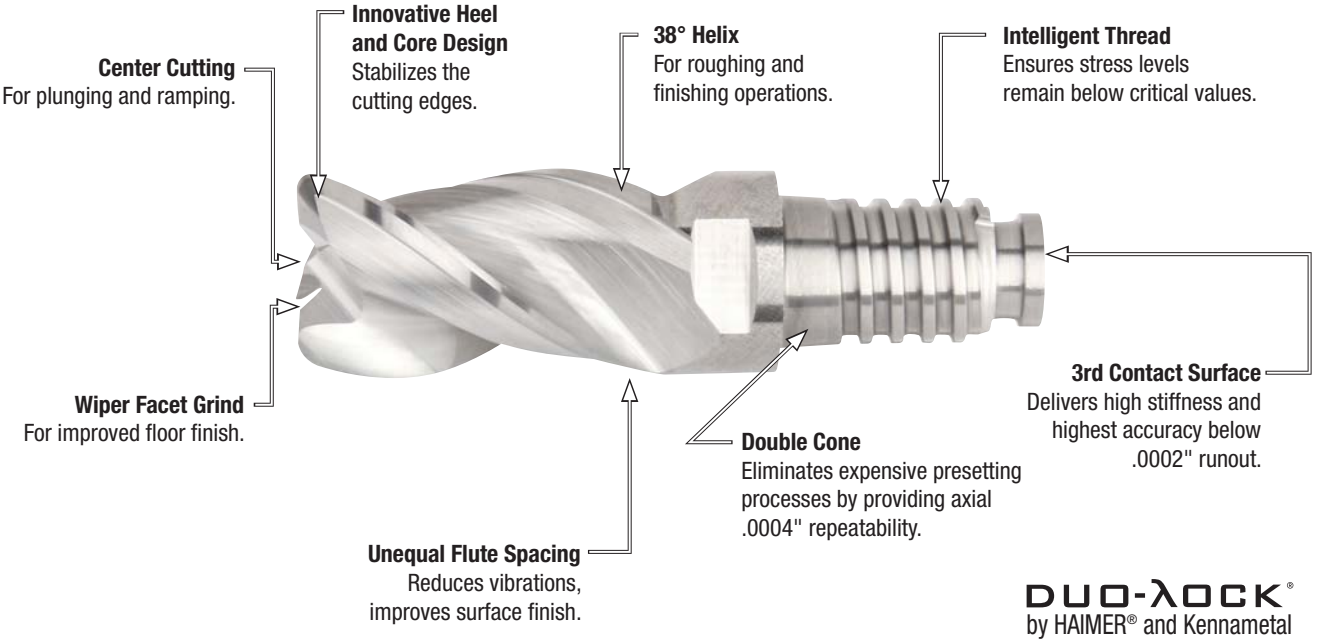
Advanced Technology

- Increase output with fewer tool changes and higher metal removal rates.
- No specific tools necessary for roughing and finishing.
- Fewer passes due to 1 x D slotting capability.
- Perfect for MQL (minimum quantity lubrication) methods.

Tailored Grades

- K600 uncoated grade for longest tool life in aluminum and other non-ferrous materials.

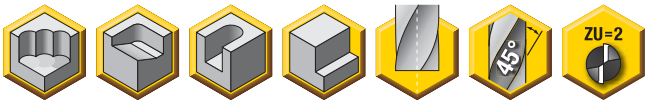
Customization



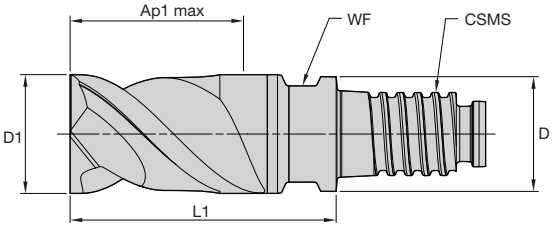
- Intermediate diameters are available between 3/8–1 1/4".

Extensive Standard Offering

- Diameter ranges 3/8–1".
- Necked, corner radii, and square-end tips available.
- Integral adapters reduce the amount of interface for maximum accuracy. Steel extensions with Safe-Lock™ by HAIMER shanks prevent pullout.
- Cut-to-size extra-long extensions available upon request off the shelf.



For high metal removal rates and superior surface finishes.



DUO-LOCK®
by HAIMER® and Kennametal

- Center cutting.
- Optimized for thin-wall applications.
- Wiper facet, special end gash, and flute geometry enable improved surface finishes.
- Standard items listed. Additional styles and coatings made-to-order.

HARVI™ II Long

- Long wall semi- and fine-finishing.
- Significant straight wall accuracy.
- Thin wall machining up to 5 x D.
- Eliminates feed rate reduction in corner machining.
- For machining titanium, steels, and stainless steels.

KC643M™

- Universal grade suitable for cutting steel, cast iron, stainless steel, and titanium.

Advanced Technology

- Five unequally spaced flutes for chatter-free machining at high feed rates, improving surface finish and tool life.
- Innovative core design increases stability for exceptionally straight walls.

Visit **kennametal.com** or contact your local Authorized Kennametal Distributor.

KENNAMETAL®

kennametal.com

DUO-λOCK®

High-Performance Modular Roughing Solid Carbide End Mills

Primary Application

Duo-Lock™ high-performance roughing tools provide superior metal removal rates while reducing machine power consumption. Applicable on a wide range of workpiece materials such as steels, stainless steels, and difficult-to-machine materials. Tailored to roughing profiles, provides excellent chip management, and reduces cutting forces to the necessary level. Combines roughing and semi-finishing for fewer tool changes.

- High-performance universal tools for almost all cutting materials.
- Lowering cutting forces and spindle power consumption.
- Center cutting for ramping, profiling, high-feed slotting, and side milling.

Features and Benefits

Advanced Technology

- Up to full length of cut for:
  - — Slotting
  - — Side milling
  - — Profiling
  - — Semi-finishing
- Various roughing profiles available to choose from for the right balance between cutting forces, feed rates, and surface quality.
- Fewer passes due to 1 x D slotting capability.

Tailored Grades

- KCPM15™ Beyond™ grade for outstanding wear protection in stainless steel to mitigate crater, depth-of-cut notching, and flank wear.
- KCSM15™ Beyond grade for exceptional tool life in titanium and stainless steels.

Customization

- Intermediate diameters are available between 3/8–1 1/4".

Extensive Standard Offering

- Diameter ranges 3/8–1".
- Necked, corner radii, and chamfered tips offered.
- Integral adapters reduce the amount of interface for maximum accuracy. Steel extensions with Safe-Lock™ by HAIMER shanks prevent pullout.
- Cut-to-size extra-long extensions available upon request off the shelf.

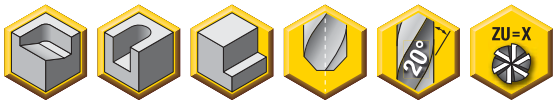
For high metal removal rates and low power consumption.

Various Roughing Profiles
Tailored cord and shallow-pitch profile for improved chip formation.

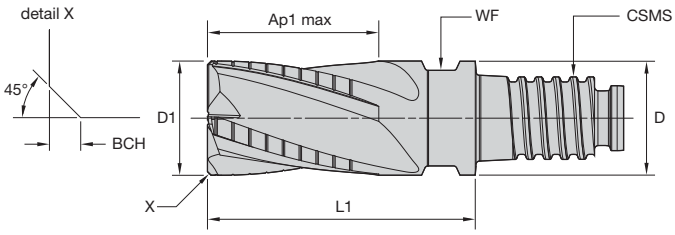
Center Cutting
For plunging and ramping.

Intelligent Thread
Ensures stress levels remain below critical values.

Various Helix Configurations
20° for roughing ISO P-M-K materials.
45° for roughing ISO S-M materials.



3rd Contact Surface
Delivers high stiffness and highest accuracy below .0002" runout.



Double Cone
Eliminates expensive presetting processes by providing axial .0004" repeatability.

KCPM15™ and KCSM15™ Grades
Long tool life.
Enables higher cutting speeds.

DUO-LOCK®
by HAIMER® and Kennametal

- Center cutting.
- Cord profile reduces machine power consumption.

DUO-λOCK®

High-Performance Modular Finishing Solid Carbide End Mills

Primary Application

Duo-Lock™ high-performance finishing tools are designed for machining titanium, steels, and stainless steels with excellent surface finishes at maximum Metal Removal Rates (MRR) in two basic geometries. The FMDF geometry is perfectly suited for finishing steels and stainless steels. The Duo-Lock™ RSM II geometry is designed for high-speed peel milling with secure chip formation and evacuation in deep cavities with the maximum amount of edges at a given diameter.

- Specifically designed geometries for finishing in a wide range of materials.
- Higher number of flutes and higher helix angles for super finishing applications.
- High metal removal rates for fewer passes, longer tool life, and superior surface finishes.

Features and Benefits

Advanced Technology

- RSM II FSDE geometry:
  - — Maximum number of flutes increases feed rates and reduces vibration.
  - — Proprietary W-shaped flute form improves chip formation and reduces cutting forces.
  - — Unequal flute spacing increases tool life and surface quality.
- FMDF geometry:
  - — Excellent geometry for steels and stainless steel.
  - — Protection radii helps extend tool life.

Tailored Grades

- KCPM15™ Beyond™ grade for outstanding wear protection in stainless steel to mitigate cratering, depth-of-cut notching, and flank wear.
- KC643M™ grade provides highest fine finishing and longest tool life.

Customization

- Intermediate diameters are available from 3/8–1".

Extensive Standard Offering

- Diameter ranges 3/8–1 1/4".
- Necked and corner radii tips available.
- Integral adapters reduce the amount of interface for maximum accuracy. Steel extensions with Safe-Lock™ by HAIMER shanks prevent pullout.
- Cut-to-size extra-long extensions available upon request off the shelf.

For highest surface quality.

45° Helix Angle with FMDF
Specifically engineered for fine finishing steels and stainless steels.

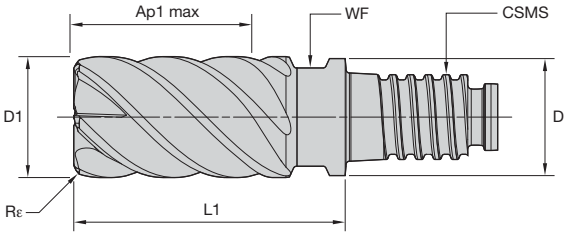
KCPM15™ Grade
Longest tool life.
Enables higher cutting speeds.

36° Helix Angle with FSDE
Specifically engineered for fine finishing titanium and other ISO S-M materials.

Intelligent Thread
Ensures stress levels remain below critical values.

DUO-LOCK®
by HAIMER® and Kennametal

3rd Contact Surface
Delivers high stiffness and highest accuracy below .0002" runout.



W-Shaped Flute Design with FSDE
Wider flute space for optimized chip evacuation.

KC643M™ Grade
Unmatched fine finishing and tool life.

Double Cone
Eliminates expensive presetting processes by providing axial .0004" repeatability.

- Center cutting.
- Standard items listed. Additional styles and coatings made-to-order.

NOTE: For better surface, finish reduce feed per tooth.
For side milling with Ap bigger than 1 x D, reduce fz by 20%!
Cylindrical shanks not recommended for full slotting.

DUO-λOCK®

Corner Rounding and Chamfering Solid Carbide Tips

Primary Application

Duo-Lock™ XRDA corner rounding and XADA chamfering tools perfectly complete the offering of high-performance end mills.

- Universal tools for almost all workpiece materials.
- Able to be reconditioned multiple times.

Features and Benefits

Advanced Technology

- Tailored amount of edges for each diameter.

Tailored Grades

- KCPM15™ Beyond™ grade for outstanding wear protection in various materials to mitigate crater, depth-of-cut notching, and flank wear.

Customization

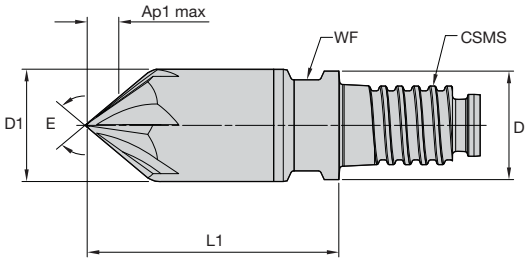
- Intermediate diameters are available between 3/8–1 1/4".
- Various angles and inverse radii possible.

Extensive Standard Offering

- Diameter ranges 3/8–5/8".
- Integral adapters reduce the amount of interface for maximum accuracy. Steel extensions with Safe-Lock™ by HAIMER shanks prevent pullout.
- Cut-to-size extra-long extensions available upon request off the shelf.

Intelligent Thread
Ensures stress levels remain below critical values.

3rd Contact Surface
Delivers high stiffness and highest accuracy below .0002" runout.



KCPM15™ Grade
Longest tool life.

Double Cone
Eliminates expensive presetting processes by providing axial .0004" repeatability.

DUO-LOCK®
by HAIMER® and Kennametal

- Non-center cutting.
- Standard items listed. Additional styles and coatings made-to-order.

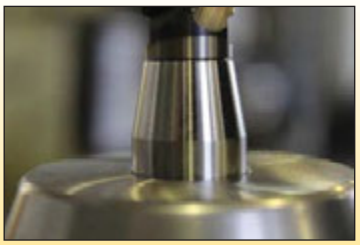
Assembly

Please wear sufficient personal safety equipment such as gloves and eye protection during assembly.

1 Clean the Duo-Lock™ cutting insert and shank coupling.

2 Mount the Duo-Lock™ adapter in a mounting block with a clamping chuck sufficient to enable torque transmission.



3 Screw the Duo-Lock™ cutting tip into adapter by hand.

Attention: Use of protective gloves is mandatory!

4 A gap of approx. 0.06–0.12" should be visible.

5 Apply the torque shown in the table. Use of a high quality common torque wrench is mandatory. The ERICKSON™ Torque Master wrench is recommended.

Grades

Coating	Grade Description		05	10	15	20	25	30	35	40	45
K600	Carbide grade made from high-quality, micrograin materials for cutting all types of workpiece materials. Very high toughness ensures a controlled wear rate. The micrograin structure enables extremely sharp cutting edges.	N			■	■	■	■			
KCPM15	Coated carbide grade with thick PVD coating and optimized chemistry and process for increased wear resistance. Outstanding protection in milling stainless steel to mitigate crater, DOCN (depth-of-cut notching), and flank wear. Excellent performance up to 52 HRC.	P			■	■	■	■			
		M			■	■	■	■			
		K			■	■	■	■			
KC643M	Coated fine-grain grade with PVD multilayer (AlTiN). KC643M™ is a very thin and hard PVD coating particularly suited for cutting steel, cast iron, stainless steel (wet), and titanium (wet). This grade can be used for materials with hardness up to 52 HRC.	P			■	■	■	■			
		M			■	■	■	■			
		K			■	■	■	■			
		S			■	■	■	■			
KC637M	Coated, tough, wear-resistant carbide grade with hard PVD coating, particularly suitable for machining steels above 48 HRC.	S	■	■	■	■					
		H	■	■	■	■					
KC635M	Coated carbide grade with TiAlN coating. KC635M is a high-performance grade for higher speeds and is the first choice for stainless steels. KC635M grade is characterized by a high hardness and wear resistance. This grade is suitable for cutting hard materials (up to 65HRC).	P			■	■	■	■

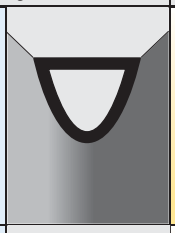
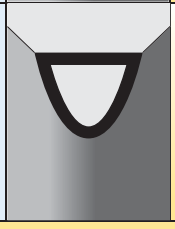
Beyond™ Solid Carbide End Milling

High-Performance milling in a new dimension





Kennametal is pleased to announce the KCPM15™ and KCSM15™ grades — the first Beyond grades for solid carbide end mills. KCPM15 and KCSM15 grades feature an improved high-performance carbide substrate with proprietary aluminum titanium nitride (AlTiN) PVD coating.

Features and Benefits

- Engineered to increase tool life and productivity by up to 30%.
- For use in milling steels and stainless steels.
- Improved resistance to cratering, flank wear, and depth-of-cut notching.

● first choice

◑ suitable with limitations

○ not recommended

Always select a tool with the shortest possible flute length whenever possible. This will increase the stability of the tool and give the best results.

When selecting an end mill, the following machining factors will affect your selection of the correct end mill for your application:

1. Tool overhang.
2. Coolant flow.
3. Machine and setup stability.
4. Machine power and torque.
5. Material to be machined.
6. Machine adapter size (DV40, DV50, HSK63, etc.).
7. See Tool Reference Guides on pages P2–P5.

Recommended Adapters per End Mill Platform

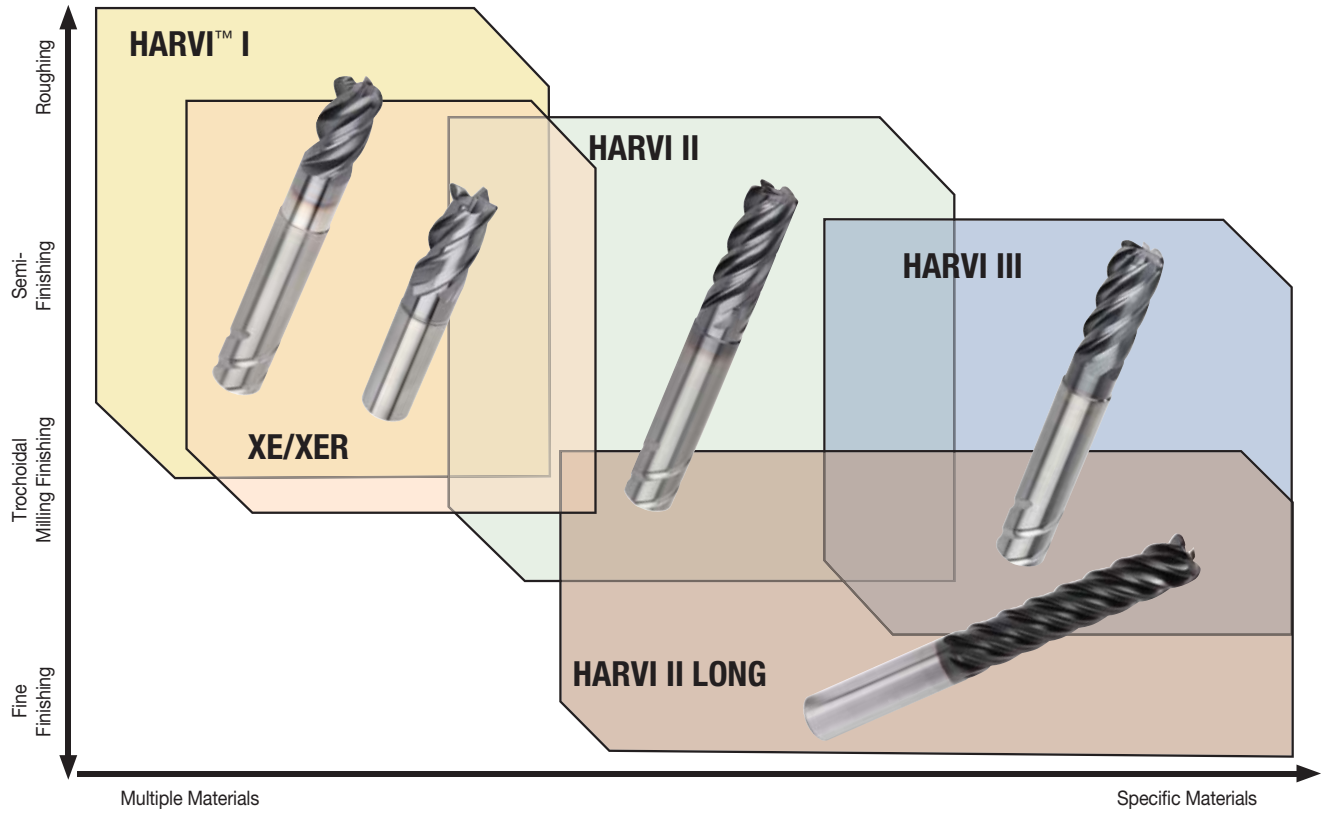
minimum quantity lubrication (MQL)	★★★★★	★★★★★	★	★	★
dampening capability	★★★★★	★	★★★	★★★	★★★
shank diameter range[3]	★★★★★	★	★★★★★	★★★★★	★
cost of toolholder	★★	★★★	★	★★★★	★★★★★
low requirement of external devices[4]	★★★★★	★	★★★★	★★★★	★★★★★
ease of handling	★★★★★	★★★	★★	★★★★	★★★★
dust resistance	★★★★★	★★★★★	★★★	★★★	★★★★
high-speed capability	★★★★★	★★★★★	★★★	★★★	★
balancing accuracy	★★★★★	★★★★★	★★★	★★★	★



[1] Radial runout may affect tool life.
[2] Radial rigidity for Weldon holder is low at a direction perpendicular to the screw.
[3] Accepts different shank diameters through the use of reduction sleeves or due to collapse range.
[4] Collet chucks and milling chucks may require the use of a torque or special wrench; Shrink Fit adapter requires a shrinking unit.

High-Performance Capability End Mills

Primary Application

High-performance capability offers plunging, slotting, and profiling at the highest possible feed rates for a wide range of materials from steel, stainless steel, cast iron, and high-temperature alloys to hard materials. These end mills are designed to provide maximum Metal Removal Rates (MRR) and to achieve superior surface conditions.

Several platforms with a wide range of diameters and corner configurations, such as chamfer, radii, sharp edges, and ball nose, are available from stock.

Designed for roughing and finishing with one tool in a wide range of applications and workpiece materials.

- Roughing, semi-finishing, and finishing with one tool.
- Outstanding metal removal rates increase productivity.
- Excellent surface quality and accuracy.
- KCPM15™ and KCSM15™ Beyond™ grades for long tool life.
- Increased process safety with Safe-Lock™ by HAIMER® shanks.

HARVI™ I

High-Performance Solid Carbide End Mills

Primary Application

The HARVI I system offers plunging, slotting, and profiling at the highest possible feed rates for a wide range of materials. These end mills are designed to provide maximum Metal Removal Rates (MRR) and to achieve superior surface conditions. A wide range of diameters and corner configurations, such as chamfer, radii, and sharp edges, are available from stock. To prevent pull out of end mills during heavy cuts, the HARVI I system is available equipped with Safe-Lock™ system by HAIMER®.

- Roughing and finishing with one tool.
- Outstanding metal removal rates increase productivity.
- KCPM15™ and KCSM15™ Beyond™ grades for long tool life.

Features and Benefits

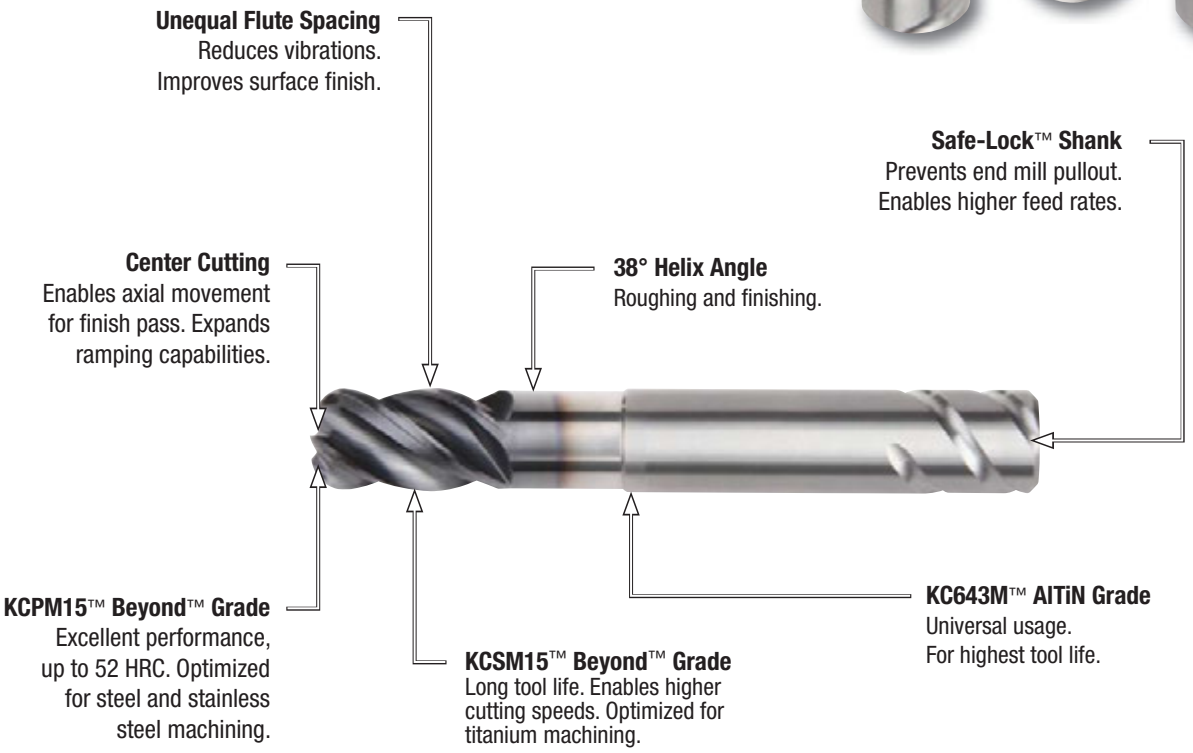
Advanced Technology

- Four unequally spaced flutes for chatter-free machining at high feed rates.
- Center cutting design for plunging and improved ramping and helical interpolation capabilities.
- 1 x D full slotting capability in:
  — Steel
  — Stainless steel
  — Titanium

Tailored Grades

- KCPM15 Beyond grade for outstanding wear protection in stainless steel to mitigate crater, depth-of-cut notching, and flank wear.
- KCSM15 Beyond grade for exceptional tool life in titanium.
- Universal KC643M™ grade suitable for cutting steel, cast iron, stainless steel (wet), and titanium (wet).

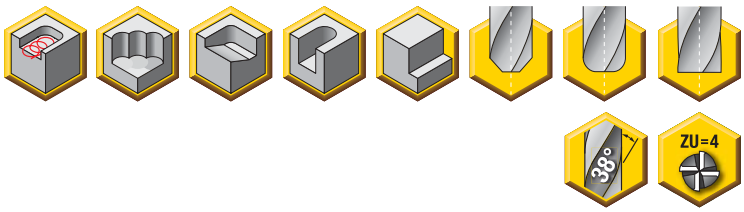
Customization



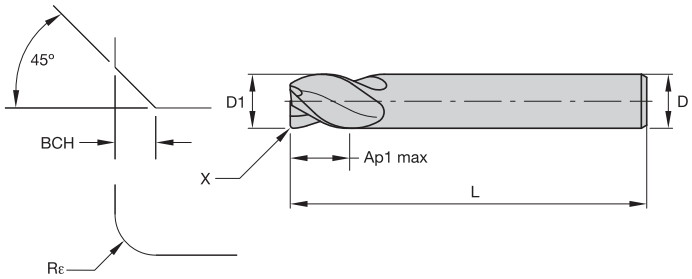
- Intermediate diameters available.
- Expanded length of tool and increased length of cut are possible.
- Chip divider geometry reduces power consumption and improves chip formation in difficult-to-cut materials.
- Internal coolant axial and radial available.
- Various shanks and non-standard coatings available.
- Multiple steps possible.

Extensive Standard Offering

- Diameter range 1/8–1-1/4".
- Necked, corner radii, chamfer, and square-end offering.
- Extended-reach length.
- Ball nose with extended length of cut.

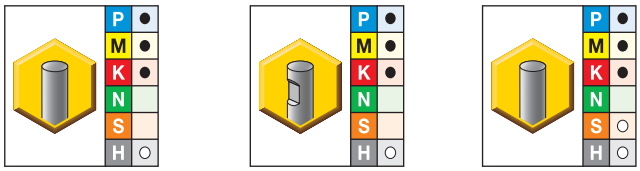


Designed for roughing and finishing with one tool in almost all materials.



SAFE-λOCK®
by HAIMER®

- Kennametal standard dimensions.
- Center cutting.
- Unequal flute spacing minimizes chatter for smoother machining.
- Single tool for both roughing and finishing operations requiring fewer setups.



End Mill Tolerances

HARVI™ II

High-Performance Solid Carbide End Mills

Primary Application

The HARVI II system is designed to provide maximum metal removal rates with five unequally spaced flutes for roughing and finishing operations in side milling, slotting, and profiling. A wide range of diameters and corner configurations, such as chamfer, radii, and sharp edges, are available from stock.

- 1 x D slotting in titanium and stainless steels with five unequally spaced flutes.
- Roughing and finishing with one tool.
- KCPM15™ Beyond™ grades for long tool life.

Features and Benefits

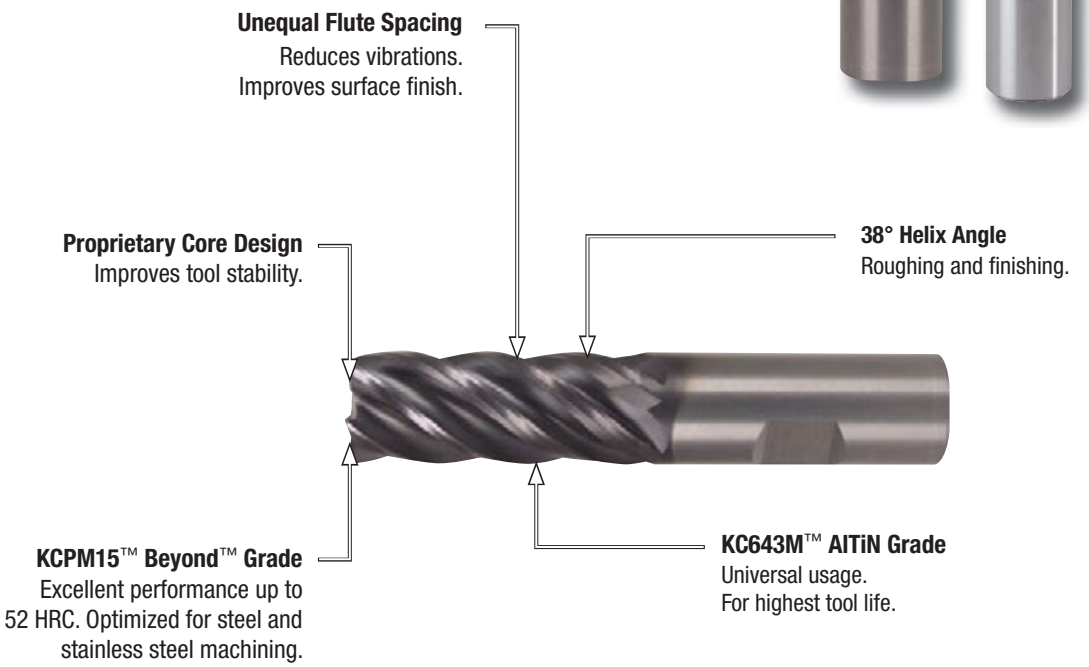
Advanced Technology

- Five unequally spaced flutes for chatter-free machining at high feed rates.
- Proprietary parabolic core design increases stability.
- Ramping up to 3°.
- 1 x D full slotting capability in:
  - — Titanium
  - — Stainless steel

Tailored Grades

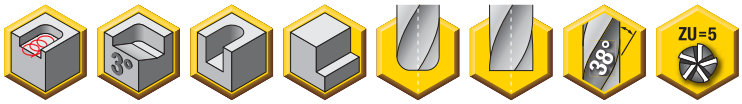
- KCPM15 Beyond grade for outstanding wear protection in stainless steel to mitigate crater, depth-of-cut notching, and flank wear.
- Universal KC643M™ grade suitable for cutting steel, cast iron, stainless steel (wet), and titanium (wet).

Customization



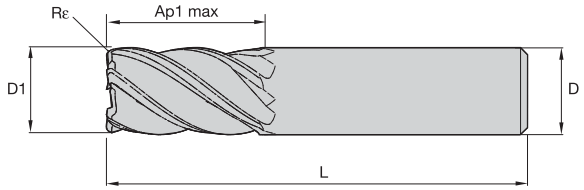
- Intermediate diameters available.
- Expanded length of tool and increased length of cut possible.
- Chip divider geometry reduces power consumption and improves chip formation in difficult-to-cut materials.
- Ball-nose version available.
- Internal coolant axial and radial available.
- Various shanks, including Safe-Lock™ by Haimer, and non-standard coatings available.
- Multiple steps possible.

Extensive Standard Offering



- Diameter range 3/16–1".
- Necked, corner radii, and square-end offering.

High-feed roughing and finishing with one tool at highest length of cut.



- Kennametal standard dimensions.
- Non-center cutting.
- Ramping up to 3°.
- Unequal flute spacing minimizes chatter for smoother machining.
- Single tool for both roughing and finishing operations requiring fewer setups.
- Five-flute geometry enables slotting up to 1 x D.

NOTE: These guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

HARVI™ II Long

High-Performance Solid Carbide End Mills

Primary Application

The HARVI II Long system is designed for machining titanium, steels, and stainless steels with excellent surface finishes at maximum Metal Removal Rates (MRR). The extended cutting length enables the HARVI II Long system to machine deep pockets with thin walls in semi-finishing and finishing operations. It also reduces the number of cuts when machining wing profiles for the aerospace industry.

- 5 x D side milling finishing operations in titanium and stainless steels.
- Exceptionally straight walls.
- Universal KC643M™ grade for long tool life.

Features and Benefits

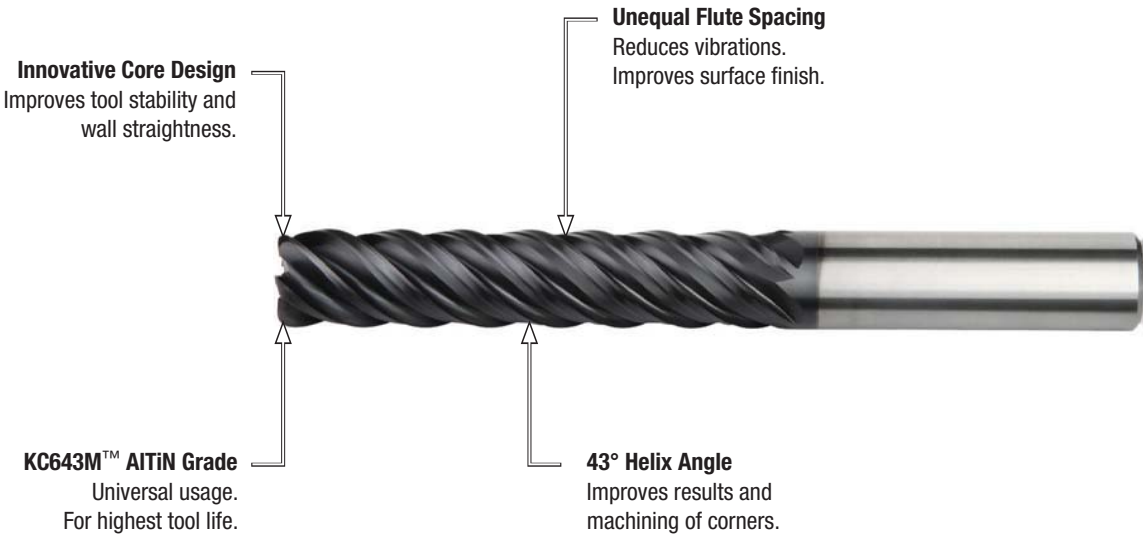
Advanced Technology

- Five unequally spaced flutes for chatter-free machining at high feed rates, improving surface finish and tool life.
- 3 x D and 5 x D lengths for reduced number of cuts.
- Innovative core design increases stability for exceptionally straight walls.
- Improved feed rate in corner machining operations versus conventional cutters.

Tailored Grades

- Universal KC643M grade suitable for cutting steel, cast iron, stainless steel (wet), and titanium (wet).

Customization

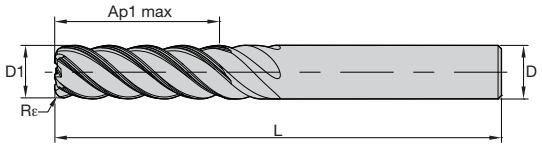


- Intermediate diameters available.
- Chip divider geometry available for reduced power consumption and improved chip formation in difficult-to-cut materials.
- Internal coolant axial, as well as radial, available.
- Various shank options, including Safe-Lock™ by Haimer, and non-standard coatings available.

Extensive Standard Offering

- Diameter range 1/4–1".
- Various corner radii in stock.

3 x D and 5 x D lengths of cut without reduced feed rates when machining corners.



- Kennametal standard dimensions.
- Non-center cutting.
- Unequal flute spacing minimizes chatter for smoother machining.
- For finishing and semi-finishing applications.
- Optimized geometry for machining corners at deep cavities.

HARVI™ III

High-Performance Solid Carbide End Mills

Primary Application

The HARVI III system takes high-performance profiling, semi-finishing, and finishing to the next level. These end mills are designed to provide maximum metal removal rates in titanium and stainless steel while achieving supreme surface conditions. A wide range of diameters and corner radii are available from stock as well as the Safe-Lock™ system by HAIMER® shanks.

- Outstanding metal removal rates increase productivity.
- Longest tool life due to eccentric relief grind and proprietary KCSM15™ Beyond™ grade.
- Increased process safety with Safe-Lock™ shanks.

Features and Benefits

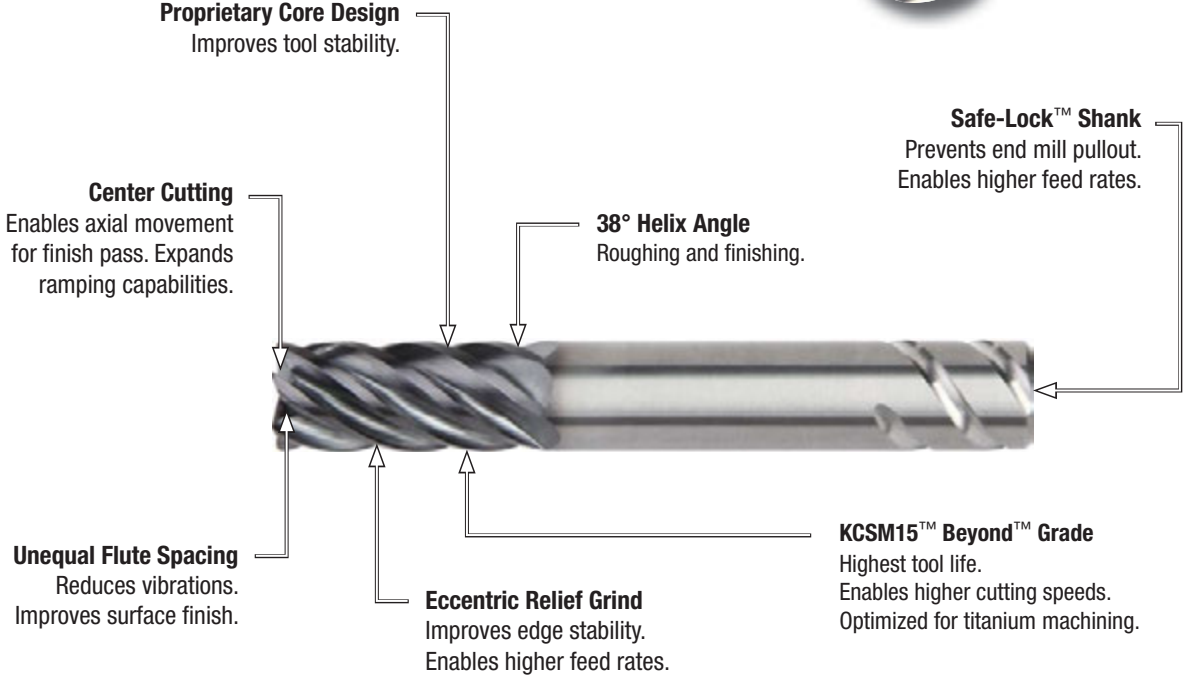
Advanced Technology

- Six unequally spaced flutes for chatter-free machining at high feed rates.
- Lower cutting forces and pressure on cutting edge through tailored axial and radial rake angles.
- Eccentric relief design increases tool life through higher edge stability.
- Proprietary tapered core provides highest tool stability in roughing and finishing operations.
- Center cutting design for higher flexibility as well as radial and axial finishing pass after roughing operation.

Tailored Grades

- KCSM15™ Beyond™ grade for exceptional tool life in titanium and stainless steels.

Customization

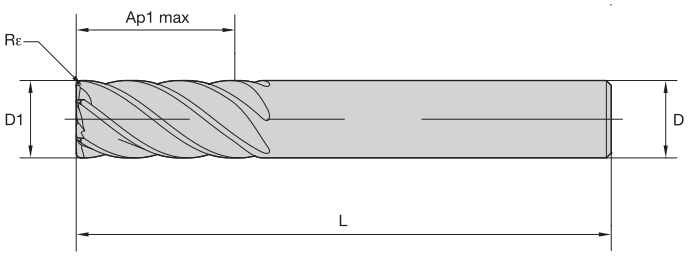


- Engineered solutions, including ball nose versions, are available upon request.

Extensive Standard Offering

- Diameter ranges 3/8–1-1/4".
- Necked, corner radii, and square-end offering.
- Round shank and Safe-Lock™ shank available.

Maximum metal removal rates in machining titanium and stainless steel with supreme surfaces.



SAFE-LOCK®
by HAIMER®

- Kennametal standard dimensions.
- Center cutting.
- Optimized geometry for titanium machining.
- Unequal flute spacing minimizes chatter for smoother machining.
- Single tool for both roughing and finishing operations requiring fewer setups.

NOTE: Those guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

EADE Solid Ceramic End Mill

- Roughing nickel-based high-temperature alloys.
- Highest productivity and longest tool life.
- Outstanding reduction of machining time.
- Less tool changes due to higher tool life.
- Benefit from throw-away type of tooling.
- Minimum cutting speed of 1300 SFM (400 m/min).

Offering

- 4-flute necked tools for slotting.
- 6-flute version for face and side milling.

KYS40

- Cutting speeds up to 3300 SFM (1000 m/min) increases Metal Removal Rates (MRR).

HARVI™ III Ball Nose

High-Performance Solid Carbide End Mills

Primary Application

HARVI III Ball Nose tooling takes high-performance profiling, semi-finishing, and finishing to the next level. Designed to provide maximum metal removal rates in titanium and stainless steel while achieving supreme surface conditions. A wide range of diameters and length variations are available from stock.

- Outstanding metal removal rates increase productivity.
- Highest tool life increases due to eccentric relief grind and proprietary KCSM15™ Beyond™ grade.

Features and Benefits

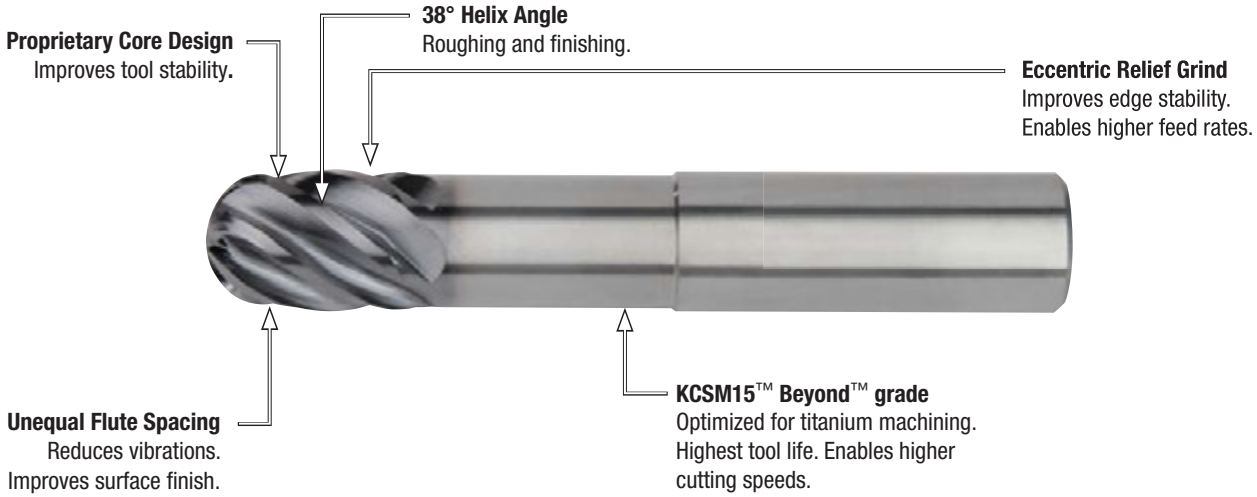
Advanced Technology

- Six unequally spaced flutes for chatter-free machining at high feed rates.
- Lower cutting forces and pressure on cutting edge through tailored axial and radial rake angles.
- Eccentric relief design increases tool life through higher edge stability.
- Proprietary tapered core provides highest tool stability at roughing and finishing operations.

Tailored Grade

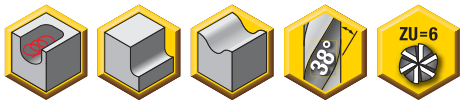
- KCSM15 Beyond grade for exceptional tool life in titanium and stainless steels.

Extensive Standard Offering



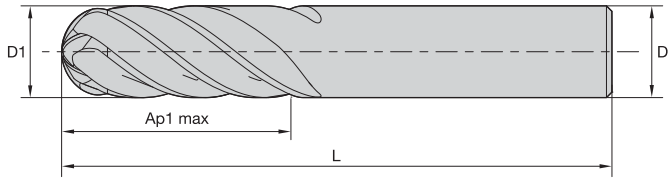
- Diameter ranges 3/8–1".
- Necked, round shank offering in two length variations.

Customization



- Engineered solutions, including shank and non-standard length versions, are available upon request.

3D profiling at highest productivity in titanium and stainless steels.



- Kennametal standard dimensions.
- Center cutting.
- Optimized geometry for titanium machining.
- Unequal flute spacing minimizes chatter for smoother machining.
- Single tool for both roughing and finishing operations requiring fewer setups.

HARVI III Ball Nose with Eccentric Relief

CHALLENGE

- Finish profile machining of keel for weapon attachment.
- Vertical machining center.
- Titanium Alloy Beta (R56400).
- External emulsion.

SOLUTION

- HARVI III ball nose Ø .5" with eccentric relief in KCSM15™.
- Six effective teeth.

CUTTING DATA

- vc 300 SFM
- fz .0018 IPT
- ap 1.2"
- ae .025"

RESULT

- Significantly increased tool life.
- Reduced machining time from 210 minutes to 90 minutes.
- Surface finish 90 RMS.

BENEFIT

- Predictable wear at main lands instead of cutting edge flaking with competitive tooling.
- Extended tool life of HARVI III eliminated a mid-part tool change.
- Improved surface finish compared to previous four-flute ball nose tools.

HARVI III Ball Nose with Eccentric Relief

CHALLENGE

- Rough profile yoke contour milling of bogey pitch trimmer.
- Lathe with driven tooling.
- 4340 low-alloy steel.
- External emulsion.

SOLUTION

- HARVI III ball nose Ø .787" (20mm) with eccentric relief in KCSM15.
- Six effective teeth.

CUTTING DATA

- vc 400 SFM
- fz .003 IPT
- ap 1.7"
- ae .1"

RESULT

- Tool completed seven workpieces compared to five workpieces with existing tooling.
- Surface finish 120 RMS.

BENEFIT

- Reduced machining time from 88 minutes to 49 minutes.
- About 30% higher feed rate due to feed per tooth and six flutes rather than four flutes.

(continued)

(continued)

HARVI III Ball Nose with Eccentric Relief

CHALLENGE

- Hem stich profile neck to flanged blend.
- Lathe with driven tooling.
- 4340 low-alloy steel.
- External emulsion.

SOLUTION

- HARVI III ball nose Ø .5" with eccentric relief in KCSM15™.
- Six effective teeth.

CUTTING DATA

- vc 350 SFM
- fz .0025 IPT
- ap .05"
- ae .05"

RESULT

- Increase in cutting speed from 150 SFM to 350 SFM.
- Tool completed ten workpieces compared to six workpieces with existing tooling.

BENEFIT

- Reduced machining time to eight minutes compared to 29 minutes with competitive four-flute ball nose tool.
- 200% increase in Metal Removal Rate (MRR).

HARVI III Ball Nose with Eccentric Relief

CHALLENGE

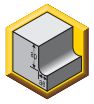
- Finish interior walls and blend filet radius.
- Horizontal machining center.
- 4340 low-alloy steel.
- External emulsion.

SOLUTION

- HARVI III ball nose Ø .5" with eccentric relief in KCSM15.
- Six effective teeth.

CUTTING DATA

- vc 350 SFM
- fz .0025 IPT
- ap .553"
- ae .05"



RESULT

- Tool completed six workpieces compared to two workpieces with existing solution.
- Surface finish 63 RMS.

BENEFIT

- Reduced machining time from 25 minutes to 10 minutes.
- Improved surface finish from 90 RMS to 63 RMS at accelerated feeds and speeds.
- Reduction in harmonics, noise level, and vibrations with HARVI III ball nose tooling.

Superior Finishing

MaxiMet™

Designed to significantly reduce machining time in aluminum! The innovative geometry designs include a wiper facet for superior surface finish on aluminum parts. MaxiMet handles roughing and finishing cuts with one tool.

- Use only one tool for roughing and finishing operations.
- Slotting is effective up to full 1 x D axial depth; side milling is effective up to 0.5 x D radial, by 1.5 x D axial depth.
- Three-flute series uses unequal flute spacing for chatter-free performance.
- Effective in a full range of machine speeds.
- Multiple corner radii and extended neck configurations are available as standard.

HARVI™ III

High-Performance Solid Carbide End Mills

Primary Application

This new HARVI III version is tailored to address traditional machining techniques, as well as high-velocity machining techniques with one tool design. This allows for the highest level of flexibility, fully utilizing the tool capabilities. This is designed specifically for high-performance profiling, semi-finishing, and finishing of titanium. The HARVI III provides maximum metal removal rates and achieves supreme surfaces. The standard offering comprises various length versions for each diameter to satisfy the need for maximum stability, as well as highest reach lengths in ball nose and square end designs.

- Outstanding metal removal rates increase productivity.
- Longest tool life due to eccentric relief grind and proprietary KCSM15™ Beyond™ grade.
- Increased process safety with Safe-Lock™ shanks.

Features and Benefits

Advanced Technology

- Six unequally-spaced flutes for chatter-free machining at high feed rates.
- Lower cutting forces and pressure on cutting edge through tailored axial and radial rake angles.
- Eccentric relief design increases tool life through higher edge stability.
- Proprietary tapered core provides the highest tool stability in roughing and finishing operations.
- Center cutting design for higher flexibility, as well as radial and axial finishing pass after roughing operation.
- Tailored rank angles allow for high performance in both traditional and high-velocity machining techniques.

Tailored Grades

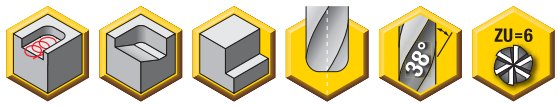
- KCSM15™ Beyond™ grade for exceptional tool life in titanium and stainless steels.

Customization

- Engineered solutions, including ball nose versions, are available upon request.

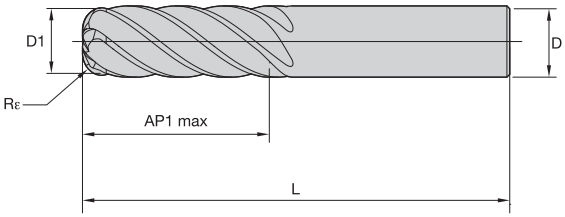
Extensive Standard Offering

- Off-the-shelf standard diameter range 1/2–1".
- 1 1/2" diameter items are made-to-order.
- Ball nose and corner radii tooling in various length.
- Round shank and Safe-Lock™ shank available.



The new HARVI™ III by Kennametal.

"The HARVI III line boasts a portfolio of 300+ tools that have met the expectations set forth in the Industry Challenge — Increased tool life, High MRR, Reduced Tool Changes, and Decreasing overall tooling cost."



- Kennametal standard dimensions.
- Center cutting.
- Optimized geometry for titanium machining.
- Unequal flute spacing minimizes chatter for smoother machining.
- Single tool for both roughing and finishing operations requiring fewer setups.

NOTE: For application data, see page P70.
*Made-to-order standard item. Standard pricing, manufacturing lead time, and minimum order quantity applies.

- Kennametal standard dimensions.
- Center cutting.
- Optimized geometry for titanium machining.
- Unequal flute spacing minimizes chatter for smoother machining.
- Single tool for both roughing and finishing operations requiring fewer setups.

HARVI III Aerospace Expansion

CHALLENGE

- Industry challenge II.
- Traditional approach.
- Ti6AL4V.
- External emulsion.

SOLUTION

- HARVI III Ø 1.250" (31.75mm) — Safe-Lock™ shank.
- SK50 Type B coolant shrink fit.
- Corner Radius R = 0.090" (2.28mm).

CUTTING DATA

- V_c 250 SFM (76 m/min).
- F_z .0074" (0,187mm).
- A_p 2.000" (50.8mm).
- A_e .100" (2,54mm).

RESULT

- After one hour of cut time, less than .001" (0,025mm) wear.
- Surface finish of 23 µ in Ra (0,6 µm Ra).

BENEFIT

- Increased tool life.
- High MRR.
- Reduced tool changes.
- Decrease overall tooling cost.

HARVI III Aerospace Expansion

CHALLENGE

- Industry challenge II.
- High-Velocity Approach.
- Ti6AL4V.
- External emulsion.

SOLUTION

- HARVI III Ø 1.250" (31.75mm) — Safe-Lock™ shank.
- SK50 Type B coolant shrink fit.
- Corner Radius R = 0.090" (2.28mm).

CUTTING DATA

- V_c 500 SFM (152 m/min).
- F_z .0095" (0,24mm).
- A_p 2.000" (50.8mm).
- A_e .020" (0,508mm).

RESULT

- After one hour of cut time, less than .0014" (0,035mm) wear.
- Surface finish of 27.5 µ in Ra (0,7 µm Ra).

BENEFIT

- Increased tool life.
- High MRR.
- Reduced tool changes.
- Decrease overall tooling cost.

HARVI III Aerospace Expansion

CHALLENGE

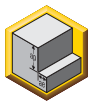
- Seat track.
- Ti6AL4V.
- External emulsion.
- Test vs. regular HARVI III.

SOLUTION

- HARVI III Ø .750" (19.05mm) — cylindrical shank
- HydroForce™ with reducer sleeve
- Corner Radius R = 0.120" (3.05mm)

CUTTING DATA

- V_c 40 m/min (130 SFM).
- F_z Varies.
- A_p From .050" (1,27mm) to 1.500" (38.1mm).
- A_e From .050" (1,27mm) to full slot.



RESULT

- Tool life increased from 45min up to 5h.

BENEFIT

- Increased tool life.
- Reduced tool changes.
- Decrease overall tooling cost.

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly.

Adjustment factor table for feed and speed calculation

	Ae/D	0.50%	1.00%	1.60%	2.00%	4.00%	5.00%	8.00%	10.00%	20.00%	30.00%
Speed factor	Kv	2.9	2.85	2.8	2	1.5	1.45	1.4	1.35	1.25	1.2
Feed factor	KFz	2.8	2.6	2.5	2.4	2.3	2.2	2	1.7	1.25	1.02

To calculate application specific cutting data, please use above KV coefficient for adaptation of cutting speed and KFz for feed respectively.
Vc new = Vc * Kv
Fz new = IPT * KFz

Calculation example:
Application: D = 1 inch; S4 material group; Ae 0,02 inch
Cutting data recommendation: 150 SFM; fz = 0.0033 IPT
Adjustment coefficients: Ae = 0,02 = inch equals 2,00%; Kv = 2; KFz = 2.4

Final cutting data recommendation:
Vc new = 150 SFM * 2 = 300 SFM
Fz new = .0033 IPT * 2.4 = .0079 IPT

HARVI™ III Taper Ball Nose

High-Performance Solid Carbide End Mills

Primary Application

HARVI III taper ball nose addresses the demand from energy and aerospace turbine customers to increase output and solve capacity issues by significantly reducing of machining time in 5-axis machining.

- Up to 50% higher Metal Removal Rates (MRR) with same tool life or up to 50% higher tool life due to 6-flute geometry with unequal flute spacing.
- Different tapered front end for highest tool stability on a variety of long-reach applications.
- Proprietary KCSM15™ grade for high tool life.

Features and Benefits

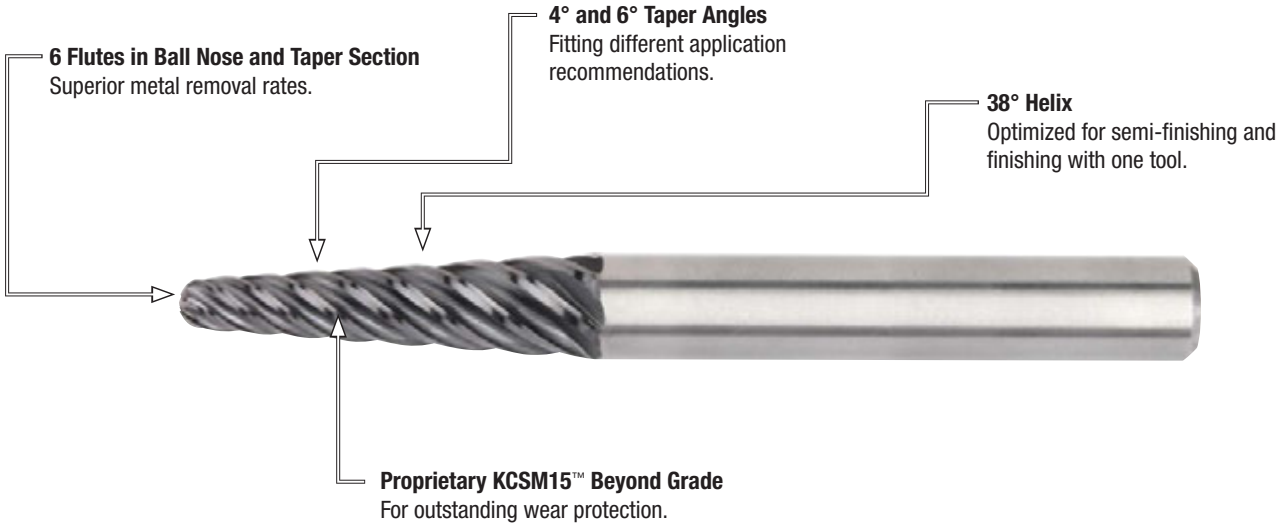
Advanced Technology

- Six flutes in ball nose and taper section for highest metal removal rates.
- Unequally spaced flutes to minimize vibrations and provide high tool life and superior surface quality.

Tailored Grades

- KCSM15 Beyond™ grade for outstanding wear protection in stainless steels and high-temperature alloys.

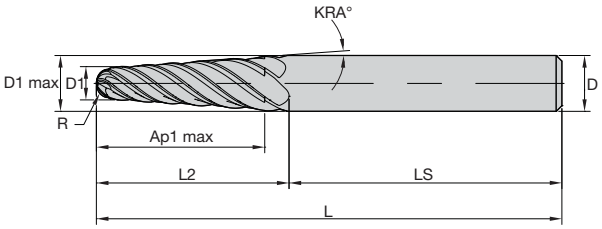
Customization



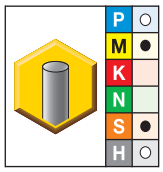
- Intermediate diameters available.
- Expanded length of tool and increased length of cut are possible.

Standard Offerings

- Diameter ranges 1/8–7/16".



Designed for 5-axis machining in steel, stainless steel, nickel-based alloys, and titanium.



- Center cutting.
- 6 flutes for highest material removal rates.
- Unequal flute spacing minimizes chatter for smoother machining.
- 2 taper angle versions for optimized stability in long-reach operations.
- Single tool for both semi-finishing and finishing operations requiring fewer setups.
- Optimized geometry for stainless, nickel-based-alloys, and titanium machining.

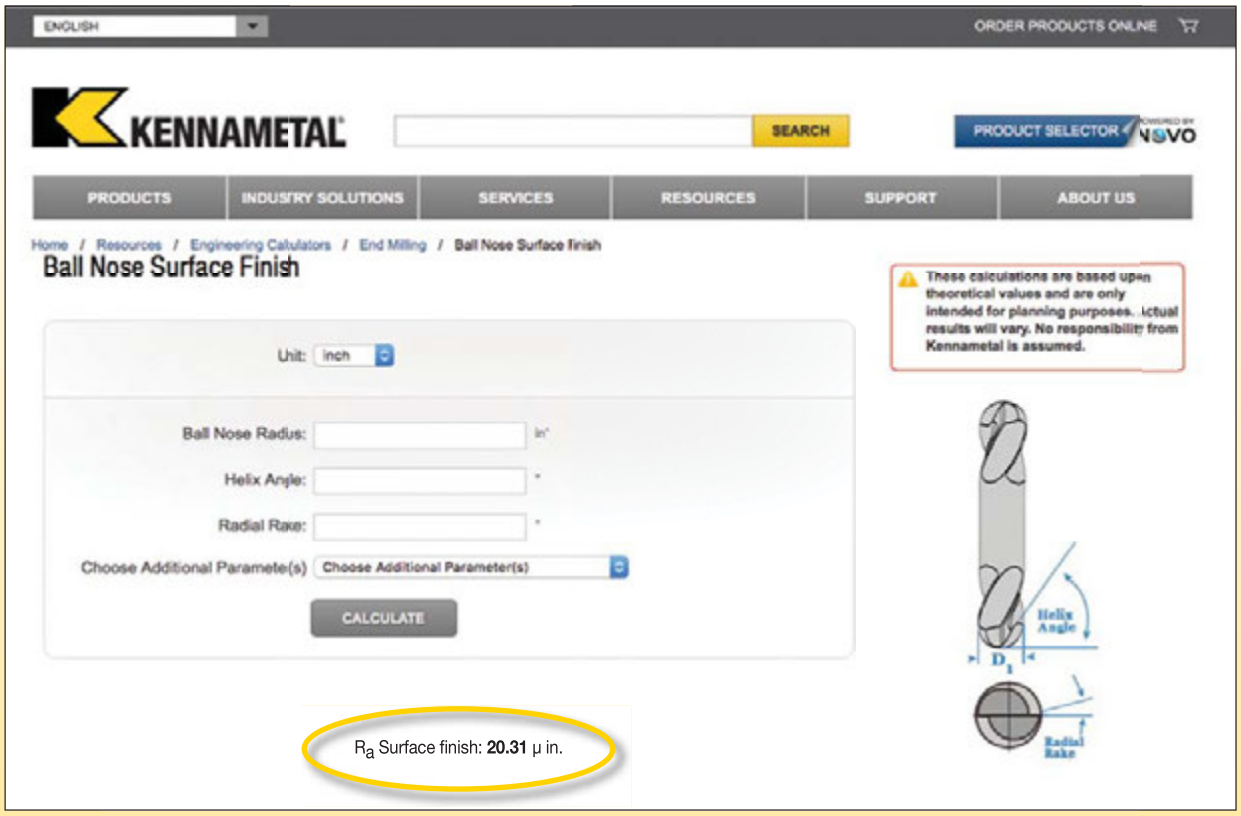
NOTE: For application data, see page P80.

The Economical Milling Cutter Line

GOmill™

The GOmill line is specifically engineered to work on short length-of-cut applications in multiple workpiece materials, like soft and hard steels up to 48 HRC, stainless steels, high-temperature alloys, and cast iron. With the very short overall length and soft cutting geometries, the line is made to conform to the growing market of mill-turn machines.

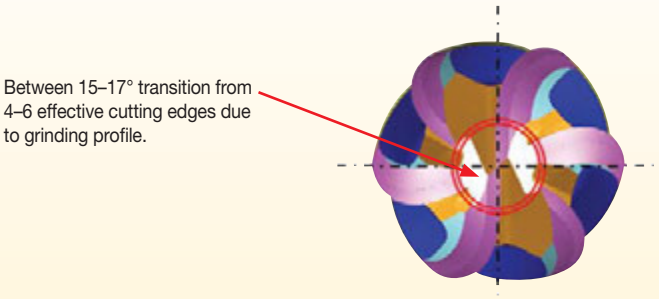
What does this mean for you?



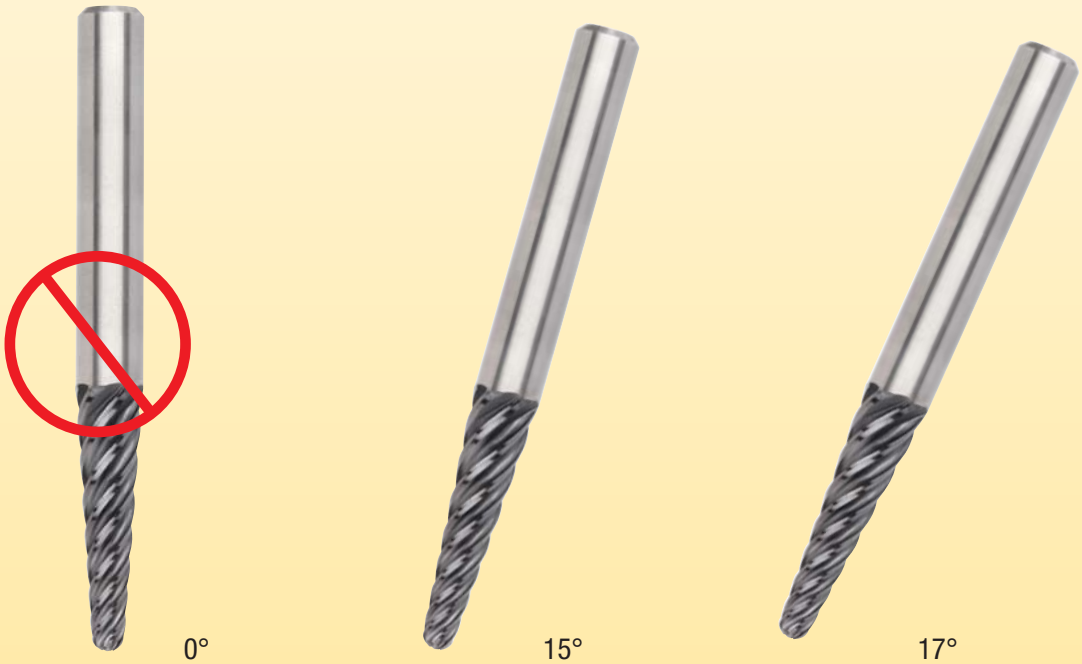
- Unequal flute spacing.
- AlTiN coating.
- Short overall tool length.
- Positive rake angle.
- Better surface finish and tool life.
- Universal usage on multiple workpiece materials.
- Higher cutting conditions, higher productivity, lower price due to less carbide.
- Lower power consumption.

Visit **kennametal.com** or contact your local Authorized Kennametal Distributor.

KENNAMETAL®



kennametal.com



Use 5–10° for radial rake angle.

Make use of calculators such as:
kennametal.com/en/resources/calculators/
end-milling-calculators/ball-nose-surface-finish.html

Not all 6 cutting edges are reaching to the center of the HARVI III taper ball nose end mill.
Therefore, certain machining angles will result in different numbers of effective cutting edges.

0°
Avoid (center cutting speed = 0)

15°
<15° z = 2 effective cutting edges

17°
>17° z = 6 effective cutting edges

HARVI™ III Taper Ball Nose UJBE

CHALLENGE

- Finishing contour milling with lightly interrupted cut.
- Blade machining for energy customer.
- X22 CrMoV12.
- External emulsion.

SOLUTION

- HARVI III taper ball nose UJBE, 6° taper angle, and KCSM15™ with 6 effective cutting edges, Ø 0.315".

CUTTING DATA

- vc 328 SFM
- fz .0020 IPT
- ap .0787"
- ae .0236"

RESULT

- 73% increased productivity.

BENEFIT

- Reduced cost per component as the tool life increased.
- New 6-flute geometry has given better surface finish compared to 4 flutes.
- Regrindable tool.

HARVI III Taper Ball Nose UJBE

CHALLENGE

- Finishing intersection and hub on blade airfoil.
- Blade machining for energy customer.
- X22CrMoV12-1.
- External emulsion.

SOLUTION

- HARVI III taper ball nose UJBE, 6° taper angle, and KCSM15 with 6 effective cutting edges, Ø 0.394".

CUTTING DATA

- vc 853 SFM
- fz .0024 IPT
- ap .0236"
- ae .0118"

RESULT

- 50% increase in feed.
- 28% increase in tool life.
- Improved surface finish and minimum wear on edges.

BENEFIT

- Reduced tooling cost.
- Reduction in cost per component.
- Good surface finish.
- Regrindable tool.

(continued)

(continued)

HARVI™ III Taper Ball Nose UJBE

CHALLENGE

- Finishing intersection and hub on blade airfoil.
- X22CrMoV12-1.
- External emulsion.

SOLUTION

- HARVI III taper ball nose UJBE, 6° taper angle, and KCSM15™.
- Ø 0.157" with 8 effective cutting edges.

CUTTING DATA

- vc 459 SFM
- fz .0006 IPT
- ap .0197"
- ae .0138"

RESULT

- Substantial increase in Metal Removal Rates (MRR).

BENEFIT

- Improved surface quality.
- Regrindable tool to reduce tool cost.

NOTE: Those guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

NOTE: Those guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

End Mills for High-Feed Milling

KenFeed™

Specifically engineered to machine hardened steel up to 65 HRC at extreme speeds and feeds.

FEATURES AND BENEFITS

- Unique tool with new 6-flute style for high productivity.
- Necked shanks provide extended reach in deep cavities.
- High-feed rates up to .0230" per tooth on a 3/4" tool.
- Machine hardened materials at 2–3x the metal removal rate of competitive end mills.
- Wide range of cutting diameters: down to 1/4" for small and medium pocket work.
- Innovative new geometry maximizes metal removal rates.
- High metal removal rates lower manufacturing costs.

Visit **kennametal.com** or contact your local Authorized Kennametal Distributor.

CXE/CXER

High-Performance Solid Carbide End Mills

Primary Application

CXE and CXER radius end mills are specially developed and manufactured for stainless steel, titanium, and high-temperature alloys that are typically found in aerospace, defense, medical, oil, and gas industries.

- Roughing and finishing with one tool.
- Highest Metal Removal Rates (MRR) optimize productivity.
- Tough and wear-resistant substrate.
- Advanced nano-composite PVD coating.

Features and Benefits

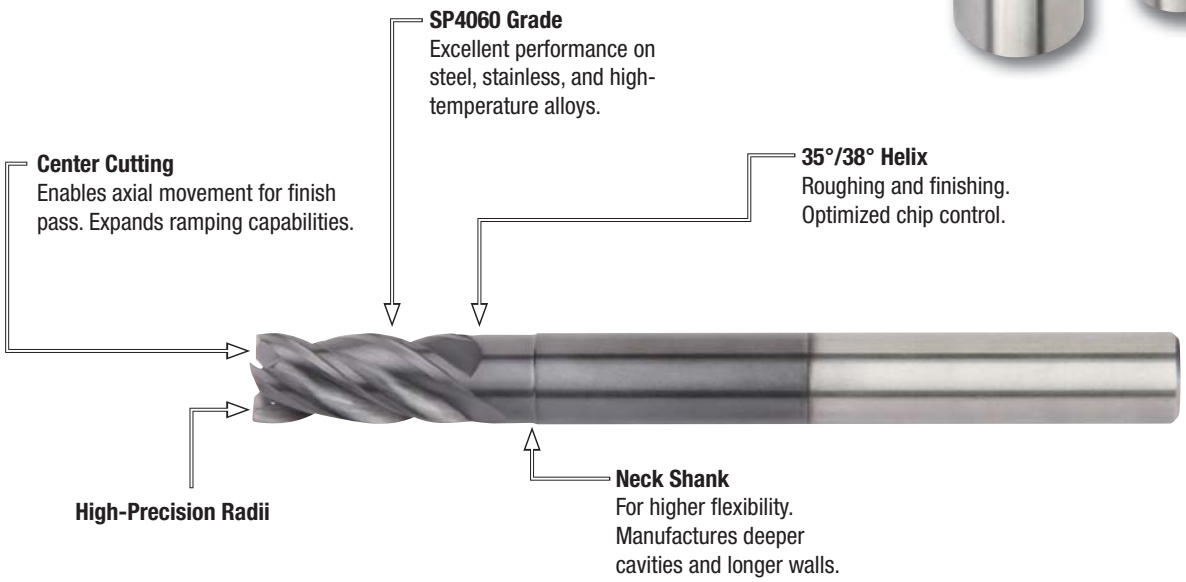
Advanced Technology

- Four flutes with unequal helix for chatter-free machining at high feed rates.
- Center cutting for helical operations and pocketing.
- Front-end design and unequal helix for optimized chip control.

Tailored Grades

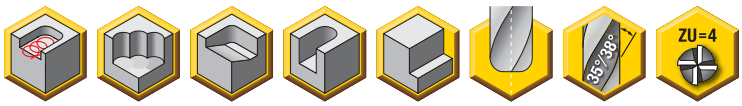
- SP4060 grade with tough and wear-resistant substrate, advanced nano-composite PVD coating for highest tool life.

Customization

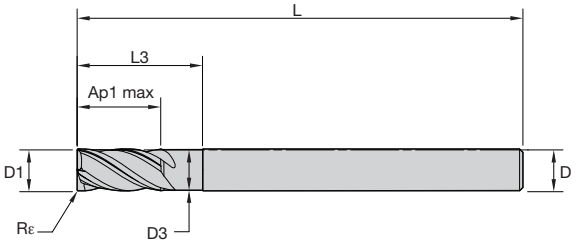


- Intermediate diameters available.
- Expanded length of tool and increased length of cut are possible.

Standard Offering



- Diameter range 1/8–1".



Designed for roughing and finishing with the highest Metal Removal Rates (MRR) in demanding materials.

- Asymmetrical flute spacing and variable helix configuration minimizes chatter and harmonics for smoother machining.
- Center cutting.
- Single tool for both roughing and finishing operations requiring fewer setups.
- Standard items listed. Additional styles and coatings made-to-order.

High-Performance Solid Carbide Roughing End Mills

Primary Application

High-performance roughers can be applied in a wide range of workplace materials such as steels, stainless steels, cast irons, and in certain cases, hardened materials. Tailored roughing profiles reduce cutting forces to the necessary level or combine roughing and semi-finishing for fewer tool changes.

- High-performance universal tools for almost all cutting materials.
- Lower cutting forces and spindle power consumption.
- Center cutting for plunging, ramping, profiling, high-feed slotting, and side milling.

Features and Benefits

Advanced Technology

- Up to full length of cut for:
  - — Slotting
  - — Side milling
  - — Profiling
  - — Semi-finishing
- Various roughing profiles available for the right balance between cutting forces, feed rates, and surface quality.

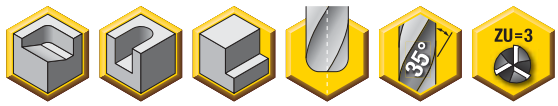
Tailored Grades

- From proprietary KCPM15™ Beyond™ grade for outstanding wear to uncoated tools suitable for a variety of workpiece materials.
- Universal KC643M™ grade suitable for cutting steel, stainless, and titanium.

Customization

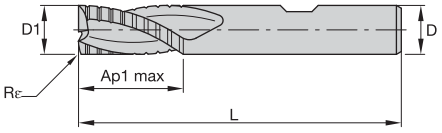
- Intermediate diameters available.
- Corner radii for near-shape roughing operations available.
- Various shank options, including the Safe-Lock™ system by HAIMER®, and non-standard coatings available.
- Internal coolant for improved chip evacuation and extended tool life.

Extensive Standard Offering



- Diameter range 1/4–1".
- Weldon® shank for maximum torque transmission.

Highest metal removal rates — even on unstable machines or workpiece clamping.



- Kennametal standard dimensions.
- Center cutting.
- Chipbreaker profile.

NOTE: These guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

RSM II

Multi-Flute End Mills

Primary Application

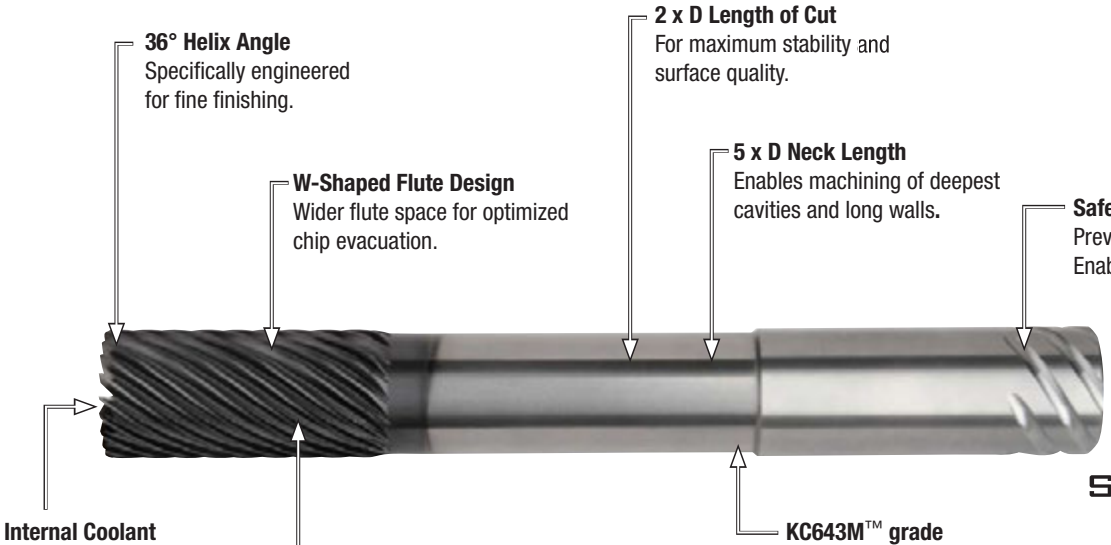
RSM II offers the highest productivity in machining aerospace structural components in titanium and titanium alloys. The RSM II is designed to utilise high-speed peel milling strategies with secure chip formation and evacuation in deep cavities. RSM II is available with the Safe-Lock™ system by HAIMER®.

- Excellent metal removal rates.
- Highest surface quality.
- Unmatched tool life and wear resistance using grade KC643M™.
- Highest process security.

Features and Benefits

Advanced Technology

- Maximum number of flutes for increased feed rates and less vibration tendency.
- Proprietary W-shaped flute form improves chip formation and reduces cutting forces.
- Unequal flute spacing increases tool life and surface quality.
- Proprietary AlTiN KC643M grade for increased tool life.



Customization

- Custom overall length and length of cut.
- Different radii per diameter.
- Custom shank styles.
- Tapered versions available.
- Uncoated K600 grade for milling critical-to-fly components.

Extensive Standard Offering

- Each diameter has an optimized number of flutes for constant edge-to-flute space ratio.
- Different radii per diameter.
- Safe-Lock™ and round shank.

36° Helix Angle
Specifically engineered for fine finishing.

W-Shaped Flute Design
Wider flute space for optimized chip evacuation.

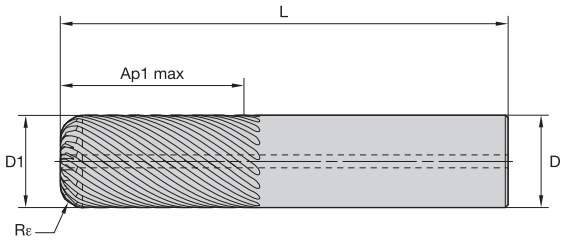
2 x D Length of Cut
For maximum stability and surface quality.

5 x D Neck Length
Enables machining of deepest cavities and long walls.

Safe-Lock™ Shank
Prevents end mill pullout. Enables higher feed rates.

SAFE-λOCK® by HAIMER®

Internal Coolant
Increases tool life and flushes out chips in deep cavities.



Eccentric Relief Grind
Improves edge stability and enables higher feed rates.

KC643M™ grade
Unmatched fine finishing and tool life results.

K600™ Uncoated Grade
Addresses critical-to-fly applications for uncoated tools.

- Kennametal standard dimensions.
- Non-center cutting.
- Optimized geometry for titanium machining.
- Unequal flute spacing minimizes chatter for smoother machining.

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions.
For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

FSDE 15-Flute End Mill

CHALLENGE

- Finishing contour milling on aerospace part with interrupted cut.
- Depth of cut: 1.575" (40mm).
- Titanium alloy R56400.
- External emulsion.

SOLUTION

- RSM II multi-flute cutter with KC643M™.
- Ø .787" (20mm) with 15 effective cutting edges and .158" (4mm) radius.

CUTTING DATA

- vc 230 SFM
- fz .0030 IPT
- ap 1.569"
- ae .001"

RESULT

- 3.75 times longer tool life compared to competitor solution.

BENEFIT

- Machining time reduction of 46%.
- Metal removal rate increase of 87%.

FSDE 11-Flute End Mill

CHALLENGE

- Finishing long channel on aerospace frame part.
- Depth of cut: 1.535" (39mm).
- Titanium alloy.
- External emulsion.

SOLUTION

- RSM II multi-flute cutter with KC643M.
- Ø .625" (15.875mm) with 11 effective cutting edges and .003" (0.762mm) radius.

CUTTING DATA

- vc 425 SFM
- fz .0021 IPT
- ap 1.55"
- ae .001"

RESULT

- 2.5 times higher feed rates compared to initial solution.

BENEFIT

- Machining time reduction of 60%.
- Metal removal rate increase of 150%.

(continued)

(continued)

FSDE 15-Flute End Mill

CHALLENGE

- Finishing external profile.
- Depth of cut: .787" (20mm).
- Titanium alloy 6Al4V.
- External emulsion.

SOLUTION

- RSM II multi-flute cutter with KC643M™.
- Ø .787" (20mm) with 15 effective cutting edges and .158" (4mm) corner radius.

CUTTING DATA

- vc 492 SFM
- fz .0020 IPT
- ap .784"
- ae .0024"

RESULT

- 50% tool life increase.
- 3x cutting speed.
- Nearly 8x the feed rates.

BENEFIT

- Machining time reduction of 81% from 43.1–8.4 min vs competitor solution.
- Metal removal rate increase of 360% vs competitor solution.

FSDE 19-Flute End Mill

CHALLENGE

- Finishing external profile.
- Depth of cut: .787" (20mm).
- Titanium alloy 6Al4V.
- External emulsion.

SOLUTION

- RSM II multi-flute cutter with KC643M.
- Ø .984" (25mm) with 19 effective cutting edges and .039" (1mm) corner radius.

CUTTING DATA

- vc 492 SFM
- fz .0020 IPT
- ap .784"
- ae .0024"

RESULT

- 50% tool life increase.
- 3x cutting speed.
- Nearly 8x the feed rates.

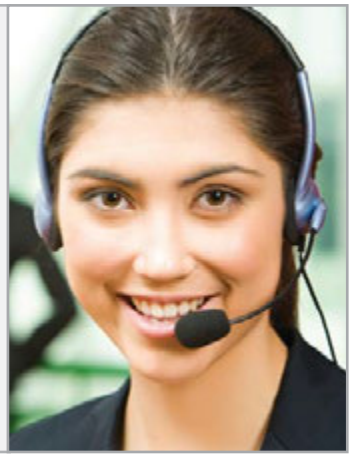
BENEFIT

- Machining time reduction of 81% from 43.1–8.3 min vs competitor solution.
- Metal removal rate increase of 366% vs competitor solution.

Materials to Cut	• Titanium and titanium alloys. • Nickel-based alloys. • Cobalt-based alloys. • Steels (P4–P5). • Stainless steels (M2–M3). • Hardened steels (H1).
Cutting Speed	• Refer to application data recommendation. • Highly dynamic machines recommended.
Feed Rate	• Refer to application data recommendation. • Highly dynamic machines recommended. • High-speed peel milling strategies require control of adequate feed rates.
Depth of Cut	• High-speed peel milling requires small depth of cut (approximately 5% of diameter) not exceeding 0.0393" (1mm).
Coolant	• Internal coolant for machining cavities. • External coolant for peripheral milling.
Adaptation	• Shrink Fit adaptation is preferred as alternate recommendation. • High-Performance Milling Chucks (HPMC) are applicable. • Collect chucks are not recommended due to high runout.
Roughing Application	• Not recommended.
Finishing Application	• Finishing and semi-finishing.
Milling Strategy	• Peel milling strategies are recommended. • Trochoidal milling is not recommended for this tool.
Applications	• Shoulder milling. • Shoulder milling and fine finishing. • Peel milling and HPC techniques. • Non-center cutting. • No ramping and helical interpolation.
Corner Machining	• Pre-mill corner pocket to leave appropriate depth-of-cut for finishing application. • Use RSM with depth-of-cut at approximately 5% of diameter and below 0.0393" (1mm). • RSM ll tool radius shall be smaller than final corner radius.
Engineered Solutions	• Available upon request.
Reconditioning Service	• Available with standard Kennametal reconditioning procedures. • Check services under Kennametal website for detailed information.

Service and Support

Customer Application Support (CAS)



Get Fast and Reliable Answers to Your Toughest Metalcutting Problems

Our Customer Application Support (CAS) Team is the metalworking industry's leading help desk resource for tooling application solutions and problem resolution.

Easy Access to Proven Metalworking Expertise!

Kennametal Customer Application Engineers assist customers and engineering groups throughout the world with expert tool selection and application recommendations for the entire range of Kennametal tooling.

SERVICE LEVEL EXCELLENCE	Fast telephone response. Quick technical solutions. Efficient case management.
SERVICES	Operating parameters. Process optimization. Hardware support. Tooling selection. Troubleshooting.
BEST-IN-CLASS SUPPORT TOOLS AND TECHNOLOGY	Materials database. Application calculators. Tooling performance experts.

High-Performance Solid Carbide Finishing End Mills

Primary Application

High-performance finishing end mills can be used for a wide range of workpiece materials such as steel, stainless steel, cast titanium, high-temp alloys, and in certain cases, hard materials.

- High-performance tools for excellent surface quality and accuracy.
- Reduce harmonics for chatter-free machining.
- Different front and flute styles for a wide range of applications like open contour, contour milling, and pocketing, and milling long and thin walls.

Features and Benefits

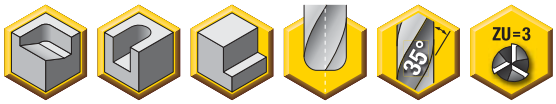
Advanced Technology

- Various styles available to choose from for the right application and workpiece material.
- Designated platforms for aerospace, transportation, and general engineering requirements.
- Selective styles for machining up to 6 x D.

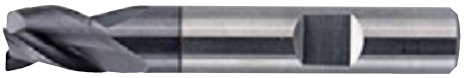
Tailored Grades

- Wide range of grades from uncoated to proprietary Beyond™ grades to cover a wide range of requirements.

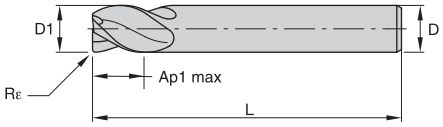
Highest metal removal rates and surface finish.



Customization



- Intermediate diameters available.
- Expanded length of tool and increased length of cut are possible.
- Different radii available.



Standard Offering

- Diameter range 1/8–1".

- Center cutting.

NOTE: These guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on > 1/2" diameter.

DUO-λOCK®

Replaceable head system

- High accuracy and repeatability.
- Maximum stability and productivity.
- Solid carbide performance.

DUO-λOCK®
by HAIMER® and Kennametal

Offering

- HARVI™ I, II, and III.
- Roughers and finishers.
- Aluminum and high-feed cutters.
- Corner rounding and chamfering tools.

Advanced Technology

- Up to 1 x D full slotting.
- 1,5 x D side milling up to 50% radial engagement.
- Extensive straight shanks, conical shanks, and integral adapters.
- Proprietary HARVI geometries enable roughing and finishing with one tool.

Visit **kennametal.com** or contact your local Authorized Kennametal Distributor.

KENNAMETAL®

kennametal.com

MaxiMet™

Primary Application

The MaxiMet system provides extraordinary metal removal rates and combines roughing and finishing operations with any aluminum plunging, slotting, and profiling application. Its proprietary flute geometry is designed for high stiffness and improved chip evacuation, and generates exceptional wall to floor perpendicularity in thin-wall applications. To ensure a superior floor surface finish, the MaxiMet front geometry is equipped with a wiper facet grind.

- Use only one tool for roughing and finishing operations.
- Slotting depths up to 1 x D as well as side milling up to 0.5 x D radial and 1.5 x D axial engagement.
- Unequal flute spacing for chatter-free performance with the 3-flute series.
- Multiple corner radii and extended neck configurations available as standard.

Features and Benefits

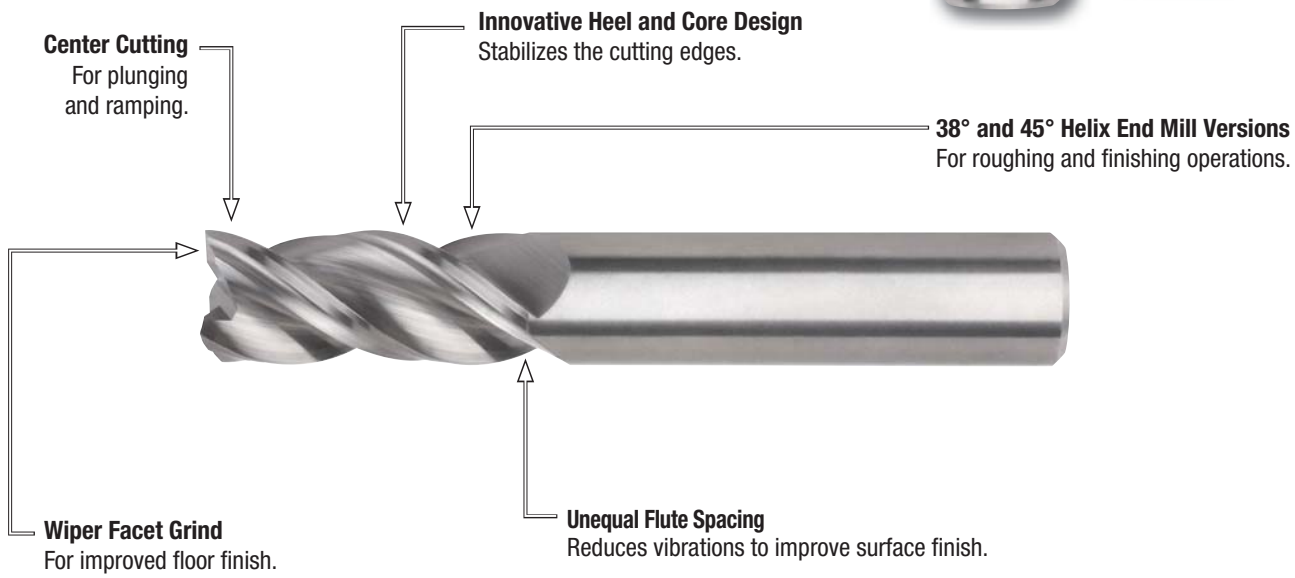
Advanced Technology

- Increase output with fewer tool changes and increased metal removal rates.
- No specific tools for roughing and finishing necessary.
- Fewer passes due to 1 x D slotting capability.
- Perfect for MQL (minimum quantity lubrication) methods.

Tailored Grades

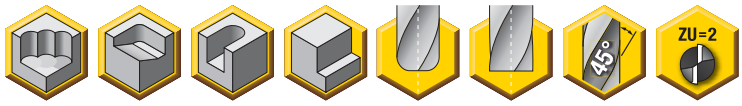
- K600 uncoated grade for longest tool life in aluminum and other non-ferrous materials.

Customization



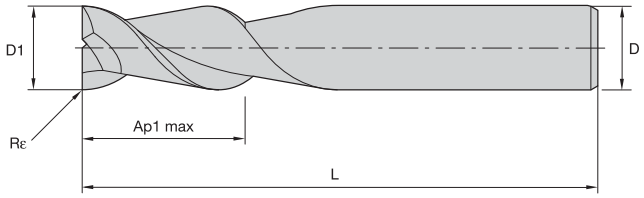
- Intermediate diameters available.
- Custom solutions available for machining titanium and other high-temperature alloys.
- Internal coolant axial and radial available.
- Various shank options and non-standard coatings available.

Extensive Standard Offering



- Diameter ranges 3/16–1".
- Extended neck for long-reach applications and radii and sharp corner configurations.

Solid carbide end mills for high metal removal rates and superior surface finishes in aluminum.



- Kennametal standards dimensions.
- Center cutting.
- Effective in thin wall applications.
- Wiper facet, special end gash, and flute geometry provide better surface finishes.
- Unique geometry delivers maximum metal removal rates.

NOTE: These guidelines may require variations to achieve optimum results. For better surface finish, reduce feed per tooth.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.
For cutting aluminum with high silicon, coating is recommended.
Ap for spindle with ceramic bearings, multiply by 0.5.
For better surface finish, reduce feed per tooth.
For tools with reach > 3 x D, reduce fz by 20%.
For tools with reach > 5 x D, reduce fz by 30%.
For tools with reach > 10 x D, reduce vc and fz by 30%.

High-Performance Aluminum Solid Carbide End Mills

Primary Application

High-performance aluminum end mills from Kennametal provide the highest Metal Removal Rates (MRR) and high-quality surfaces while reducing machining time. The center-cutting design enables plunging, slotting, and profiling applications in any type of aluminum workpiece materials. Designed to deliver exceptional chip evacuation and generate the highest floor-to-wall straightness. The portfolio offers many styles to choose from.

- Tools combine roughing and finishing operations beside pure rougher with cord profile.
- Capable of full slot depths up to 1 x D and side milling up to 0.5 x D radially at 1.5 x D axially.
- Multiple corner radii and extended neck configurations available as standard.

Features and Benefits

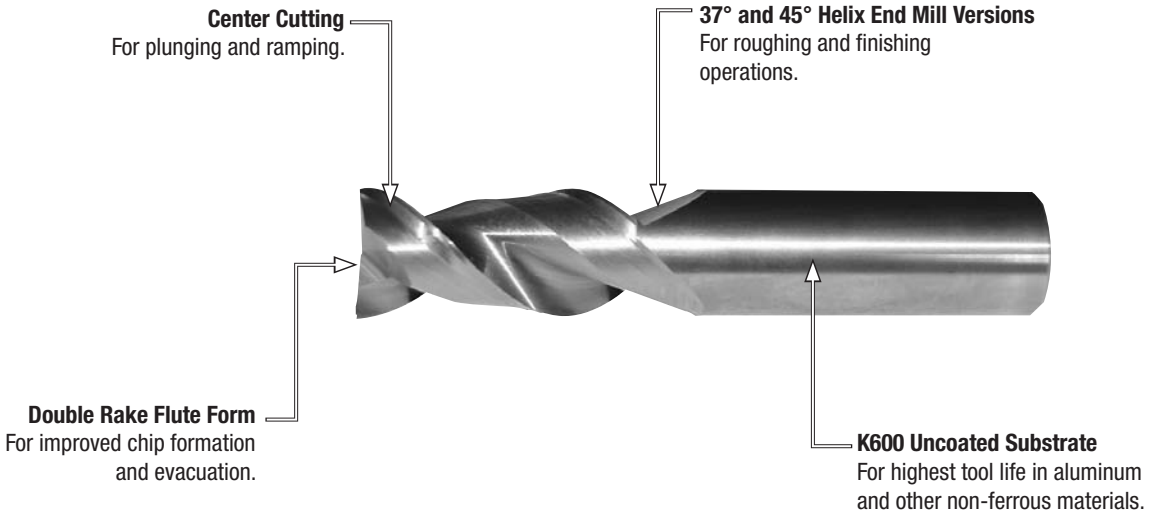
Advanced Technology

- Double rake flute form for improved chip formation and evacuation.
- No specific tools for roughing and finishing necessary.
- Fewer passes due to 1 x D slotting capability.
- Best suited for MQL (minimum quantity lubrication) applications.

Tailored Grades

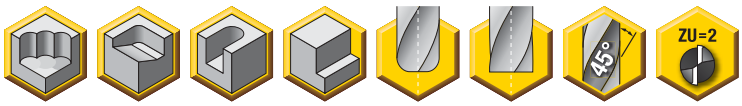
- K600 uncoated grade for highest tool life in aluminum and other non-ferrous materials.

Customization



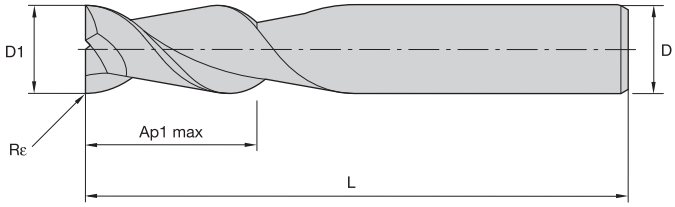
- Intermediate diameters available.
- Expanded length of tool and increased length of cut are possible.
- Internal coolant axial and radial available.
- Various shank options and non-standard coatings available.
- TiB_2 grade KC651M available as custom solution.

Extensive Standard Offering



- Diameter ranges 1/8–1".
- Extended neck for long-reach applications as well as radii and sharp corner configurations.

Extended neck for long-reach applications as well as radii and sharp corner configurations.



- Double-rake flute form.
- Center cutting.

NOTE: These guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

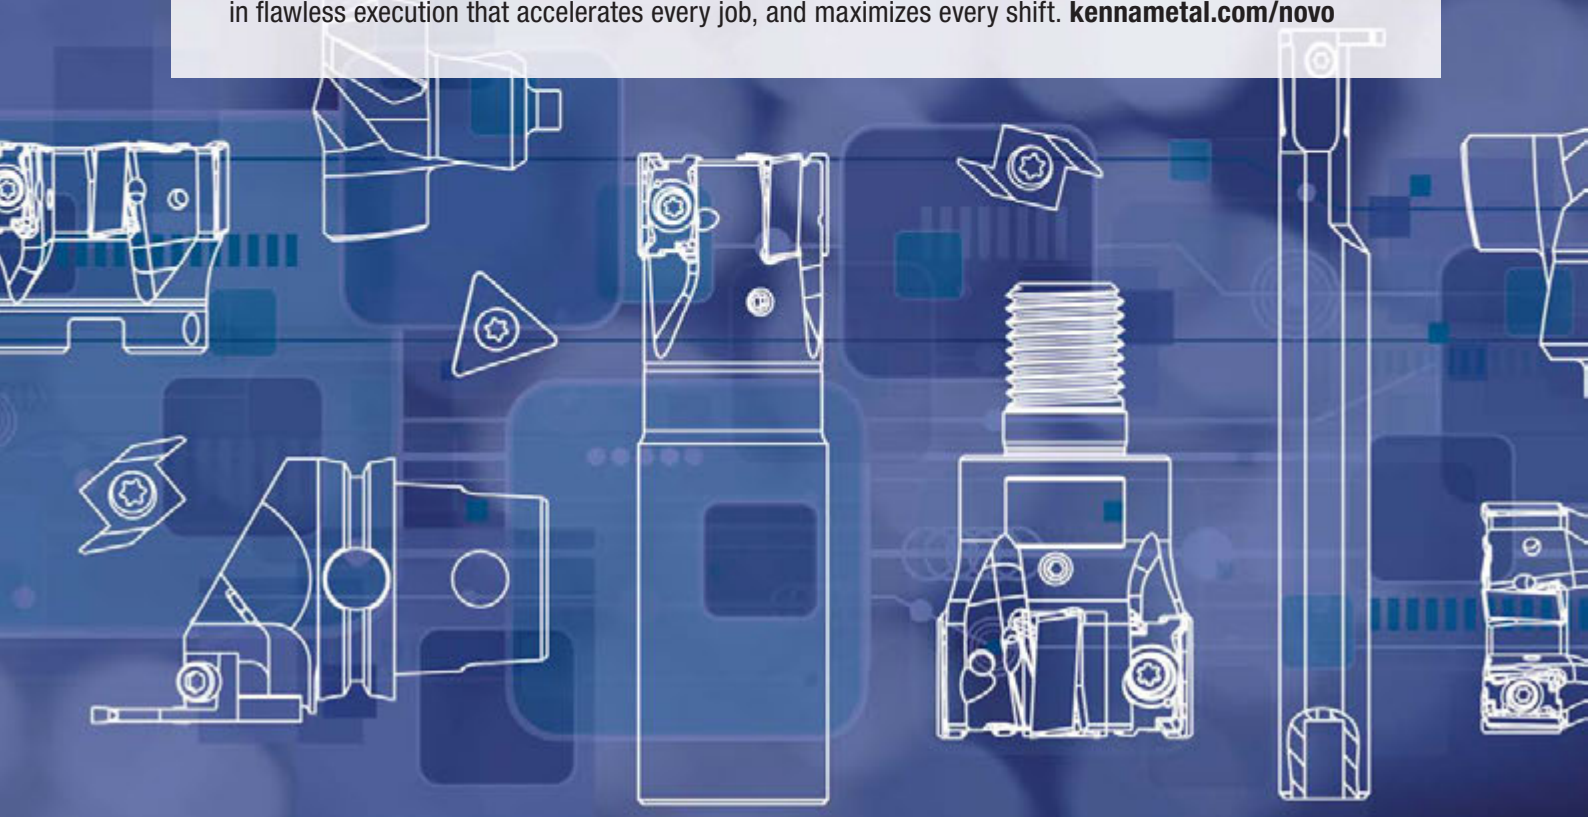
NOVO KNOWS CAD/CAM



With the addition of NOVO™ applications to your team, your CAD/CAM capabilities become much more accurate, streamlined, and productive.

Before NOVO: The programmer would be in their CAD/CAM software, programming a part. Using the tedious method of finding a tool in a catalog, and then manually inputting the tooling information from the catalog into the CAD/CAM software.

The concern is that assumptions are made, and only partial tooling information is entered.

With NOVO: The powerful digital intelligence of NOVO applications not only help the programmer find the right tool for the metalcutting job, but also automatically integrates all the tooling data into a complete CAD/CAM solution. The integration of all the tooling data increases the viability of the part being programmed, and is delivered quickly — saving you time.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximizes every shift. **kennametal.com/novo**

CFRP KCN05™ Beyond™ Grade

Solid Carbide Routers

Primary Application

KCN05 solid carbide router products provide excellent tool life and produce smooth finishes with improved edge quality when machining difficult CFRP (carbon-fiber reinforced polymer) and non-ferrous components. The unique geometries are free cutting, reduce heat generation, and provide high-quality machined surfaces.

- Designed to avoid delamination and bur formation.
- Excellent tool life due to KCN05 diamond film coating.

Features and Benefits

Advanced Technology

- Compression-style routers for trimming designed to provide high feed rates and quality edges on both sides of the material. Up-cut/down-cut geometry promotes stable cutting conditions.
- Down-cut style routers intended for surface work. Excellent ramping capabilities eliminate surface delamination machining pockets.
- Bur style for highest material removal rates and superior surface quality. Designed for trimming fiberglass and CFRP, and for slotting and profiling.

Tailored Grades

- KCN05 diamond coating uses a proprietary substrate to optimize coating adhesion and improve tool life.

Customization

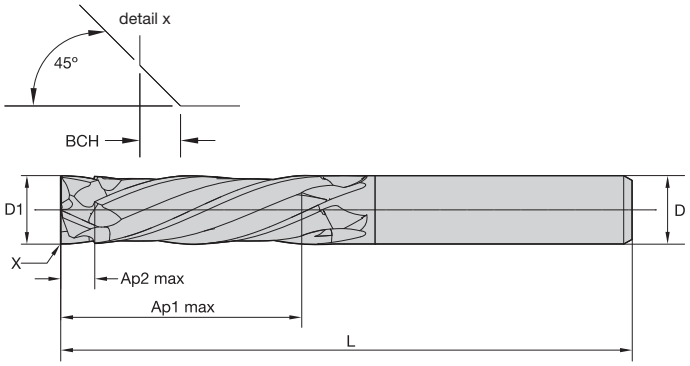
- Intermediate diameters available.
- Compression routers with six and eight flutes available for special wire CFRP.
- Bur-style routers with end cutting, drill-point cutting, and non-end cutting point styles available on request.
- K600 uncoated grade for fiberglass applications and as an economic alternative to KCN05 routers.

Extensive Standard Offering

- Diameters 1/4, 3/8, and 1/2".
- Different length versions.
- KCN05 routers.

Up-Cut/Down-Cut Geometry
Prevents delamination because cutting forces are directed inside the workpiece.

KCN05™ Diamond Coating
For excellent tool life and smooth finishes with improved edge quality.



Highest Number of Cutting Edges
For excellent temperature control and highest metal removal rates.

Extended Length of Cut Version
Enables machining in different levels for multiplying tool life of same tool.

- Kennametal standard dimensions.
- Aerospace composites and fiberglass.
- Internal air coolant for ZU = 4.

KenFeed™

Primary Application

The numerous effective cutting edges of KenFeed end mills make them the right choice for machining heat-treated steels up to 67 HRc. The KenFeed system combines roughing and semi-finishing into one tool by taking very shallow-depth cuts at extremely high feed rates to maximize metal removal. The 3 x D neck and extended-reach design is perfectly suited for pocketing using 3D machining techniques, such as ramping and helical interpolation. During face milling, the proprietary front end geometry of the KenFeed system is entirely in contact with the workpiece, providing up to 55% engagement compared to regular ball nose-type tooling that provides only 5–10%.

- Unique tool with new 6-flute style for high productivity.
- Innovative new geometry maximizes metal removal rates.
- High metal removal rates help to reduce manufacturing costs.

Features and Benefits

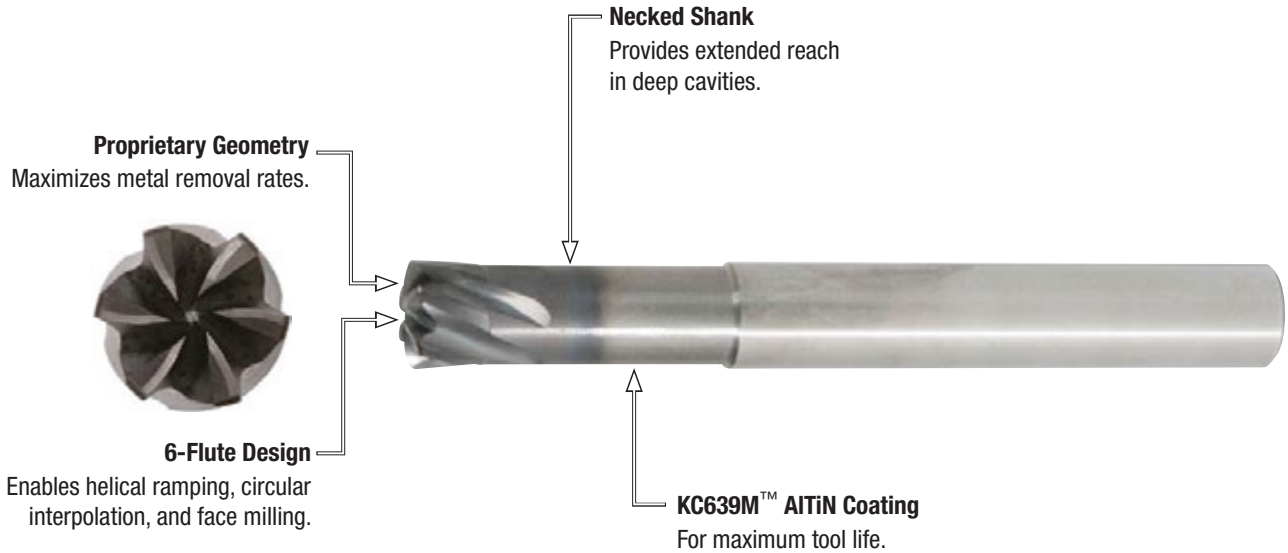
Advanced Technology

- Provides the benefits of indexable-style high-feed milling starting at 1/4".
- One tool for roughing and semi-finishing operations.
- Increases output by performing 3D machining, helical ramping, circular interpolation, face milling, and pocketing.
- Use in hardened materials from 40 to 67 HRC with two dedicated geometry variants.

Tailored Grades

- KC639M AlTiN-coated grade for longest tool life in hardened steels from 40 to 67 HRC.

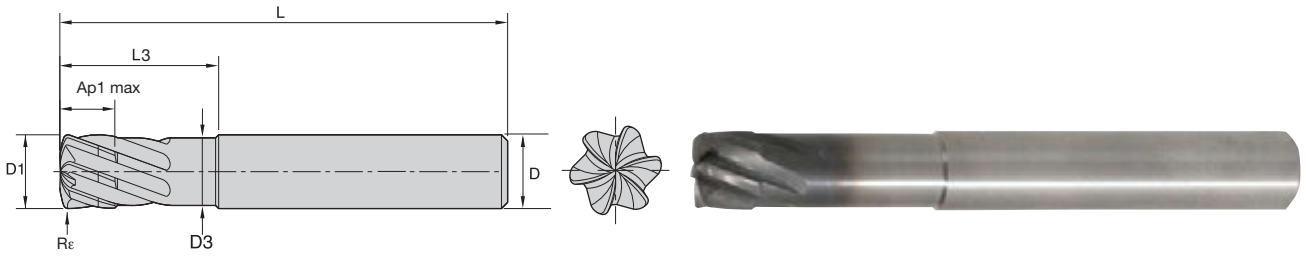
Customization



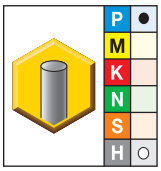
- Intermediate diameters available.
- Custom solutions available for machining titanium and other high-temperature alloys.
- Internal coolant axial and radial available.
- Various shank options and non-standard coatings available.

Extensive Standard Offering

- Diameter ranges 1/4–3/4".
- Extended neck for long-reach applications.



End mills for high-feed milling of medium and hard steels.



- Kennametal standard dimensions.
- Non-center cutting.
- High feed.

GOmill™ GP

General Purpose End Mill Series

- Flexible — plunging, slotting, and profiling.
- Complete — wide range of diameters and lengths.
- Adaptive — wide range of applications and workpiece materials.
- Economical — excellent cost-benefit ratio.

Offering

- 2-flute version for unstable conditions.
- 3-flute version as alternative to 2 and 4 flutes.
- 4-flute version for high metal removal rates.

Advanced Technology

- Roughing and finishing with one tool.
- Eccentric relief increases edge stability.

Visit **kennametal.com** or contact your local Authorized Kennametal Distributor.

KENNAMETAL®

kennametal.com

High-Performance Hard-Machining Solid Carbide End Mills

Primary Application

These end mills from Kennametal for hard machining are engineered to machine hardened steels up to 67 HRC at extreme speeds and feeds. Designed with special coatings, substrates, and geometries to extend tool life in any application that requires machining of hardened workpiece materials.

- Capable of machining hardened steels more than 60 HRC.
- Unique design enables higher feeds and speeds to increase Metal Removal Rates (MRR).
- Sophisticated coatings for maximum wear resistance.

Features and Benefits

Advanced Technology

- Negative geometry for increased edge strength.
- Reinforced core for better rigidity.
- High helix for better surface finishes.

Tailored Grades

- Universal grade KC633M™.

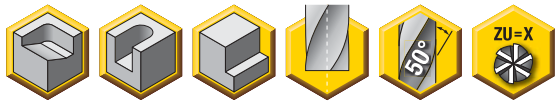
Customization

- Intermediate diameters available.
- Expanded length of tool and increased length of cut possible.
- Toroidal as well as undercutting end mills (Spherical Lollipop-Style).
- Various shank options and non-standard coatings available.
- TiAlN wear-resistant substrate grade KC637M and AlTiN grade KC643M available as custom solution.

Extensive Standard Offering

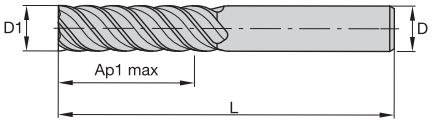
- Diameter ranges 1/8–1".
- Extended neck for long-reach applications and radii and sharp corner configurations.
- Roughing and ball nose finishing geometries.

Sophisticated coatings for maximum wear resistance.



Parabolic Core Design
Proprietary technology stabilizes end mill to avoid deflection in longer length of cut.

Various Helix End Mill Versions
Dedicated application-specific design.



KC633M™ TiAlN-Coated Substrate
For longest tool life in challenging applications.

- Kennametal standard dimensions.
- Center cutting.

NOTE: These guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

HARVI™ III Family

High-temperature alloy machining

- Profiling, semi-finishing, and finishing.
- Maximum metal removal rates in titanium and stainless steel.
- Supreme surface conditions.
- Complete family of square end, ball nose, and taper ball nose cutters.

KCSM15™

- Proprietary Beyond™ grade for exceptional tool life in titanium and stainless steels.

Advanced Technology

- Six unequally spaced flutes for chatter-free machining.
- Eccentric relief design increases tool life through higher edge stability.
- Proprietary tapered core provides highest tool stability in roughing and finishing operations.

Beyond™ EADE

Solid Ceramic End Mills

Primary Application

EADE solid ceramic end mills offer higher productivity and tool life in roughing nickel-based high-temperature alloys. Beyond grade KYS40™ delivers best-in-class tool life and exceptionally high Metal Removal Rates (MRR), surpassing those of other solutions on the market today.

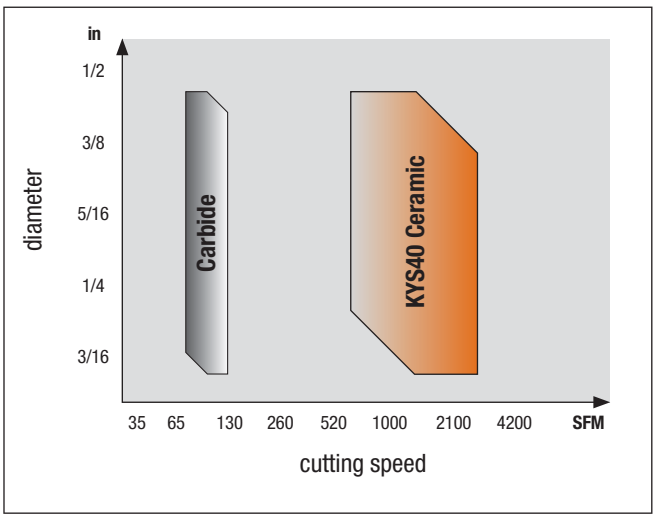
- Outstanding reduction of machining time.
- Fewer tool changes due to longer tool life.
- Benefit from throw-away type of tooling.

Features and Benefits

Advanced Technology

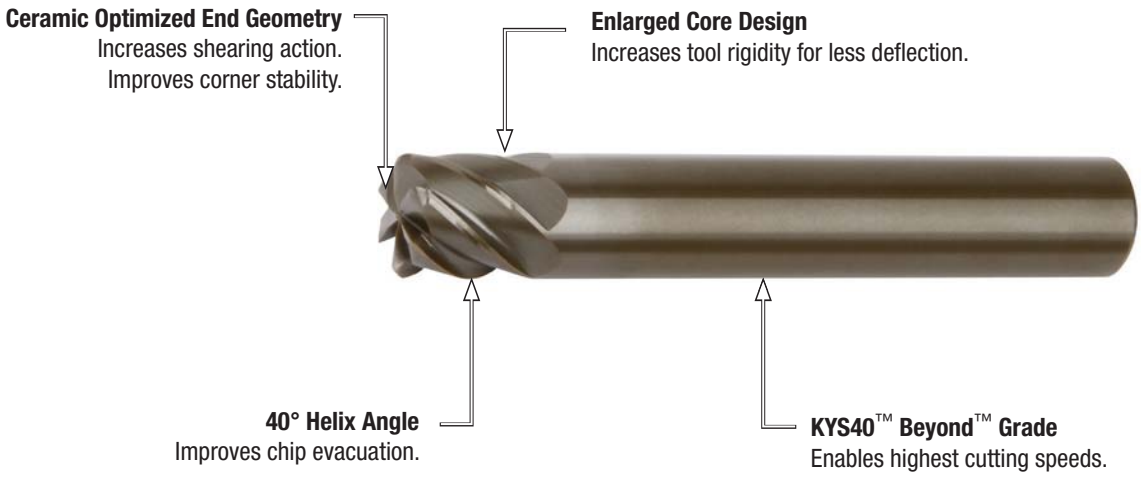
- KYS40 Beyond grade solid SiAlON ceramic designed for machining nickel-based high-temperature alloys.
- Cutting speeds up to 3300 SFM increase metal removal rates.
- Tool life up to 5x that of carbide end mills.

Extensive Standard Offering



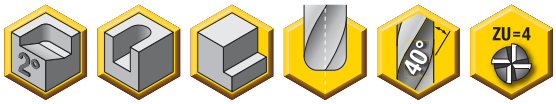
- 4-flute tooling for pocketing and slotting. Undersize end mills leaving stock for finishing operations.
- 6-flute tooling for face milling and profiling.

Customization

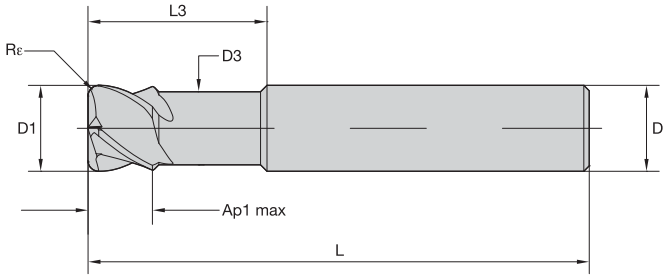


- Engineered solutions are available upon request.

Highest Cutting Speed Capability



- Increase compared to carbide.



Ceramic Optimized End Geometry
Increases shearing action.
Improves corner stability.
Enlarged Core Design
Increases tool rigidity for less deflection.
40° Helix Angle
Improves chip evacuation.
KYS40™ Beyond™ Grade
Enables highest cutting speeds.

- Kennametal standard dimensions.
- Non-center cutting.
- Ramping up to 2,5°.
- Optimized geometry for roughing nickel-based high-temperature alloys.

A New Dimension

HARVI™ II

The next generation high-performance end mill, HARVI II dramatically improves metal removal rates without reducing tool life.

- Best suited for applications in the aerospace, medical, die and mold, automotive, and general engineering markets.
- Outstanding performance in stainless steel, titanium, INCONEL®, and other high-temperature alloys and steels.
- Increased metal removal rates in roughing and finishing operations.

Advanced Technology

- Five unequally-spaced flutes for chatter-free machining at high feed rates.
- 1 x D full slotting capability in:
  - — Titanium
  - — Stainless steel

Tailored Grades

- Proprietary KCPM15™ Beyond™ grade.
- Universal KC643M™ grade.

KENNAMETAL®

kennametal.com

EADE 4-Flute End Mill

CHALLENGE

- Roughing a slot on turbine blade.
- Depth of slot .866".
- INCONEL® 718 material.
- Dry machining.

SOLUTION

- Engineered solution EADE KYS40™ ceramic end mill with extended neck.
- Ø .449" (11,4mm) with 4 effective cutting edges and .059" (1,5mm) corner radii.

CUTTING DATA

- vc 2625 SFM
- fz .0012 IPT
- ap .0197"
- ae .866"

RESULT

- Customer proprietary information.

BENEFIT

- Machining time of 1 minute 54 seconds for one slot only.
- Metal removal rate of .9 in^3/m consistently achieved.
- Productivity significantly increased.

EADE 4-Flute End Mill

CHALLENGE

- Rough profiling of small turbine blades.
- INCONEL 718 material.
- Dry machining.

SOLUTION

- Standard EADE KYS40 ceramic end mill.
- Ø .449" (11,4mm) with 4 effective cutting edges and standard neck.

CUTTING DATA

- vc 2116 SFM
- fz .0012 IPT
- ap .0197"
- ae .866"

RESULT

- 3x tool life compared to 2x tool life with competitive solution in less time.

BENEFIT

- 3x higher productivity as a result of increased cutting data.
- 50% longer tool life compared to competitive carbide end mill.

(continued)

(continued)

EADE 6-Flute End Mill

CHALLENGE

- Rough profiling of aerospace parts.
- Haynes® 288 and INCONEL® 718 material.
- Dry machining.

SOLUTION

- Standard EADE KYS40™ ceramic end mill.
- Ø .394" (10mm) with 6 effective cutting edges.

CUTTING DATA

- vc 1516 SFM
- fz .0012 IPT
- ap .0197–.0394"
- ae varying

RESULT

- Customer proprietary information.

BENEFIT

- Machining time reduced.
- Productivity significantly increased.

EADE 6-Flute End Mill

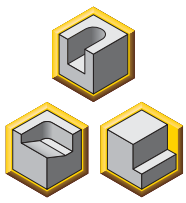
CHALLENGE

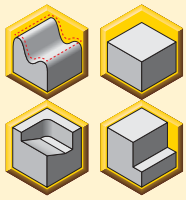
- Rough profiling of blisk (blade integrated disc).
- INCONEL 718 material (42 HRC).
- Compressed air coolant.

SOLUTION

- Standard EADE KYS40 ceramic end mill.
- Ø .472" (12mm) with 6 effective cutting edges.

CUTTING DATA





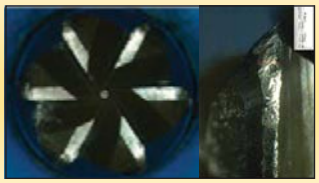
- vc 2228 SFM
- fz .0012 IPT
- ap varying up to .0197"
- ae varying

RESULT

- 2 blisk segments machined with one tool.
- 12 minute machining time per segment.

BENEFIT

- Unprecedented reduction in machining time.



Materials to Cut	• Nickel-based high-temperature alloys. • Cobalt-based alloys after consulting technical assistance. • P6 and M1-3 stainless steels after consulting technical assistance. • Do not apply on iron-based high-temperature alloys.
Cutting Speed	• Maximum RPM machine can provide recommended cutting speed: 1.300–3.300 SFM. • Highly dynamic machines recommended. • Use of spindle speeders applicable (no wet coolant).
Feed Rate	• Refer to application data recommendation. • General starting condition fz .0012 IPT.
Depth of Cut	• Refer to application data recommendation. • General starting condition ap .019".
Coolant	• Power cool nozzle preferred to flush chips away. • Pressurized air applicable. • Minimal quantity lubrication (MQL) and dry applicable. • No coolant with emulsion or oil due to thermal shock.
Adaptation	• Hydraulic chuck with or without sleeve preferred. • Collet or milling power chucks applicable. • Balancing at 25,000 RPM (2,5G) preferred.
Roughing Application	Yes
Finishing Application	No
Milling Strategy	• Conventional milling preferred at lower speeds. • Climb milling preferred at higher speeds.
4-Flute EADE	• Slotting and pocketing. • Common sizes and undersize leaving finishing stock. • Side milling possible up to ap max with increased feed. • Non-center cutting. • Ramping and helical interpolation possible under 2.5°. 
6-Flute EADE	• Profiling and face milling. • Non-center cutting. • Side milling possible up to ap max with increased feed. • Ramping and helical interpolation possible under 2°. 
Engineered Solutions	Available upon request.
Reconditioning Service	Not applicable.

Wear Indication

New

Used

Wear rate .019".
Still good to use.

End of Tool Life

Wear rate .055".
End of tool life reached.

Chip Formation

Carbide

Regular curled chips. Shape and length depend on end mill geometry and cutting data.

Ceramic

Chips are nearly like dust. Pressurized air coolant recommended to blow away chips.

Causes of and Remedies for End Milling Problems

problem	cause	remedy
Excessive bur formation	• Softness of material to cut. • Excessive wear on radii.	• Use undersize end mills that leave stock for finishing operation. • Replace tool as end of tool life reached. • Check tool runout.
Sudden breakage	• Vibration of the workpiece. • Unstable tool clamping. • Use of 6-flute tooling in slotting.	• Check workpiece and tool clamping. • Use of 4-flute EADE recommended.
Chips sticking	• Lack of cutting speed.	• Increase cutting speed.
Chipping	• Unstable tool and/or workpiece clamping. • Initial cutting speed too high.	• Check workpiece and tool clamping. • Reduce cutting speed during initial cut and increase as cutting continues.
Thermal cracks	• Wet coolant.	• Do not use wet coolant.

GOmill™

Economical High-Performance End Mills

Primary Application

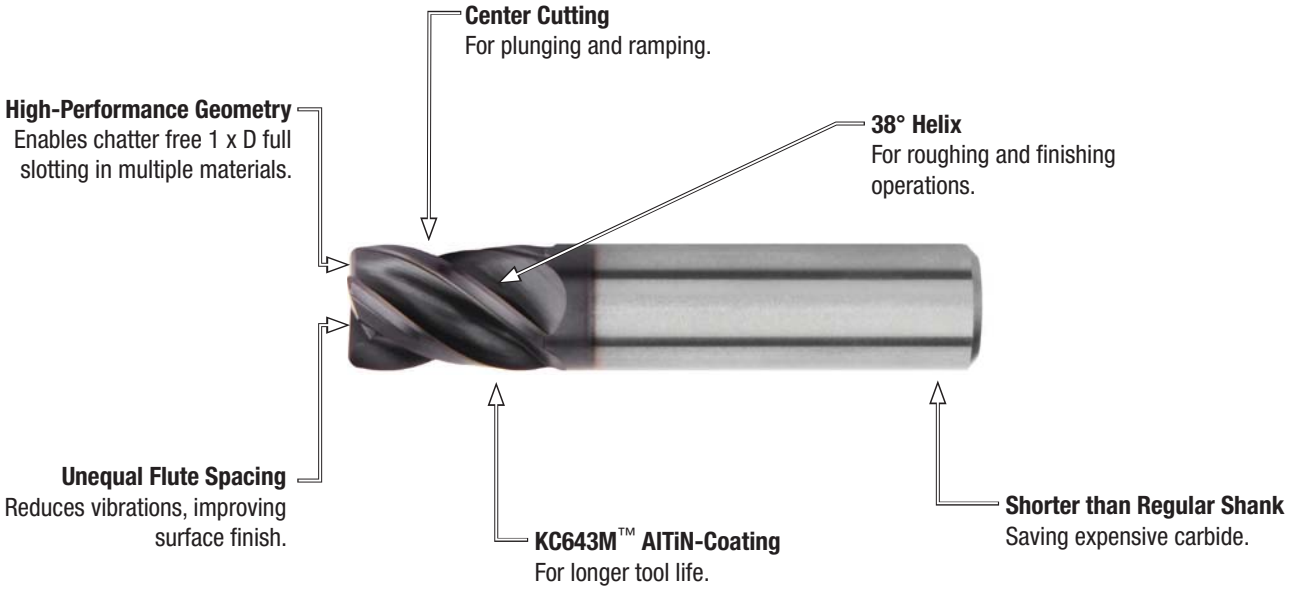
The GOmill line is specifically engineered to work on short length-of-cut applications in multiple workpiece materials, like soft and hard steels up to 48 HRC, stainless steels, high-temperature alloys, and cast iron. With the very short overall length and soft cutting geometries, this line is made to conform to the growing market of mill-turn machines.

- Extremely stable cutting tool due to extremely short design.
- Less vibration due to unequal flute spacing.
- Soft cut to support mill-turn machines as well driven units in lathe tooling.
- Use a new GOmill with 100% performance instead of regrinding.

Features and Benefits

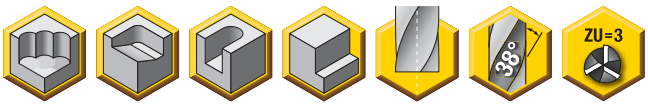
Advanced Technology

- The 3-flute sharp and 4-flute chamfer versions support roughing, semi-finishing, and finishing applications.
- The 3-flute ball nose tool supports roughing and semi-finishing applications.
- All geometries work in slotting and side milling applications up to 1 x D depth of cut.
- Shortened shank applicable for all common clamping adapters without modifications. Only use clamping sleeve in hydraulic chucks to avoid vibrations.



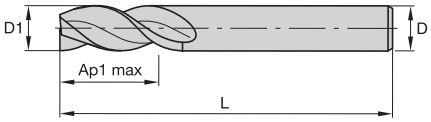
Tailored Grades

- Universal KC643M™ grade suitable for cutting steel, cast iron, stainless steel (wet), and titanium (wet).



Extensive Standard Offering

- Diameter ranges 5/64–1/2".
- Straight shanks.



Center Cutting
For plunging and ramping.
High-Performance Geometry
Enables chatter free 1 x D full slotting in multiple materials.
38° Helix
For roughing and finishing operations.
Unequal Flute Spacing
Reduces vibrations, improving surface finish.
KC643M™ AlTiN-Coating
For longer tool life.
Shorter than Regular Shank
Saving expensive carbide.

- Kennametal standard dimensions.
- Center cutting.
- Unequal flute spacing.
- Roughing/finishing.

NOTE: For application data, see page P171.
Use reducer sleeve when clamping in hydraulic chucks.
*Made-to-order standard item. Standard pricing, manufacturing lead time, and minimum order quantity applies.

- Kennametal standard dimensions.
- Center cutting.
- Unequal flute spacing minimizes chatter for smoother machining.
- Single tool for both roughing and semi-finishing operations for fewer setups.

● first choice

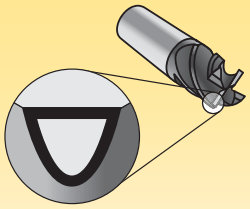
◑ suitable with limitations

○ not recommended

Always select a tool with the shortest possible flute length whenever possible. This will increase the stability of the tool and give the best results.

When selecting an end mill, the following machining factors will affect your selection of the correct end mill for your application:



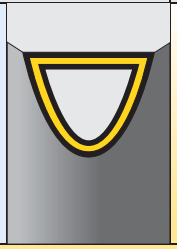
1. Tool overhang.
2. Coolant flow.
3. Machine and setup stability.
4. Machine power and torque.
5. Material to be machined.
6. Machine adapter size (CV40, CV50, HSK63, etc.).

Select Adapter per Technical Data/Characteristics

Technical data/characteristics	Toolholders				
	HydroForce™ high torque	Shrink Fit	Milling chuck	ER collet chuck	Weldon® adapter
torque transmission	★★★★★	★★★★	★★★★★	★★	★★★★★
radial runout (T.I.R.)[1]	★★★★★	★★★★★	★★★★	★★★	★
radial rigidity[2]	★★★★	★★★★★	★★★	★★★	★★★
tool length adjustment	★★★★★	★★★★	★	★★★★	★★
tool shank tolerance requirement	★★★★	★★	★★★	★★★★★	★★★
through coolant	★★★★★	★★★★★	★★★	★★★	★★
minimum quantity lubrication (MQL)	★★★★★	★★★★★	★	★	★
dampening capability	★★★★★	★	★★★	★★★	★★★
shank diameter range[3]	★★★★★	★	★★★★★	★★★★★	★
cost of toolholder	★★	★★★	★	★★★★	★★★★★
low requirement of external devices[4]	★★★★★	★	★★★★	★★★★	★★★★★
ease of handling	★★★★★	★★★	★★	★★★★	★★★★
dust resistance	★★★★★	★★★★★	★★★	★★★	★★★★
high-speed capability	★★★★★	★★★★★	★★★	★★★	★
balancing accuracy	★★★★★	★★★★★	★★★	★★★	★

[1] Radial runout may affect tool life.
[2] Radial rigidity for Weldon holder is low at a direction perpendicular to the screw.
[3] Accepts different shank diameters through the use of reduction sleeves or due to collapse range.
[4] Collet chucks and milling chucks may require the use of a torque or special wrench; Shrink Fit adapter requires a shrinking unit.

Grades and Grade Descriptions



Coatings provide high-speed capability and are engineered for roughing to finishing.

KC633M 	Coated carbide grade with PVD multilayer coating. KC633M™ is designed for dry milling most types of material, apart from the hardened variety. This grade is characterized by high hardness and wear resistance. It provides outstanding protection for solid carbide tools against cratering and abrasion.	P			■	■	■	■

GOmill™ GP General Purpose Solid Carbide End Mills · 2 Flute

Primary Application

GOmill GP series offers plunging, slotting, and profiling with long tool life on a wide range of workpiece materials. They are designed to provide high Metal Removal Rates (MRR) and achieve good surface quality at an excellent cost-benefit ratio. A wide range of diameters and lengths are available with chamfered edge and ball nose as stocked standard.

- Roughing and finishing with one tool.
- Excellent cost-benefit ratio.
- Multilayer KC633M™ grades for high tool life.

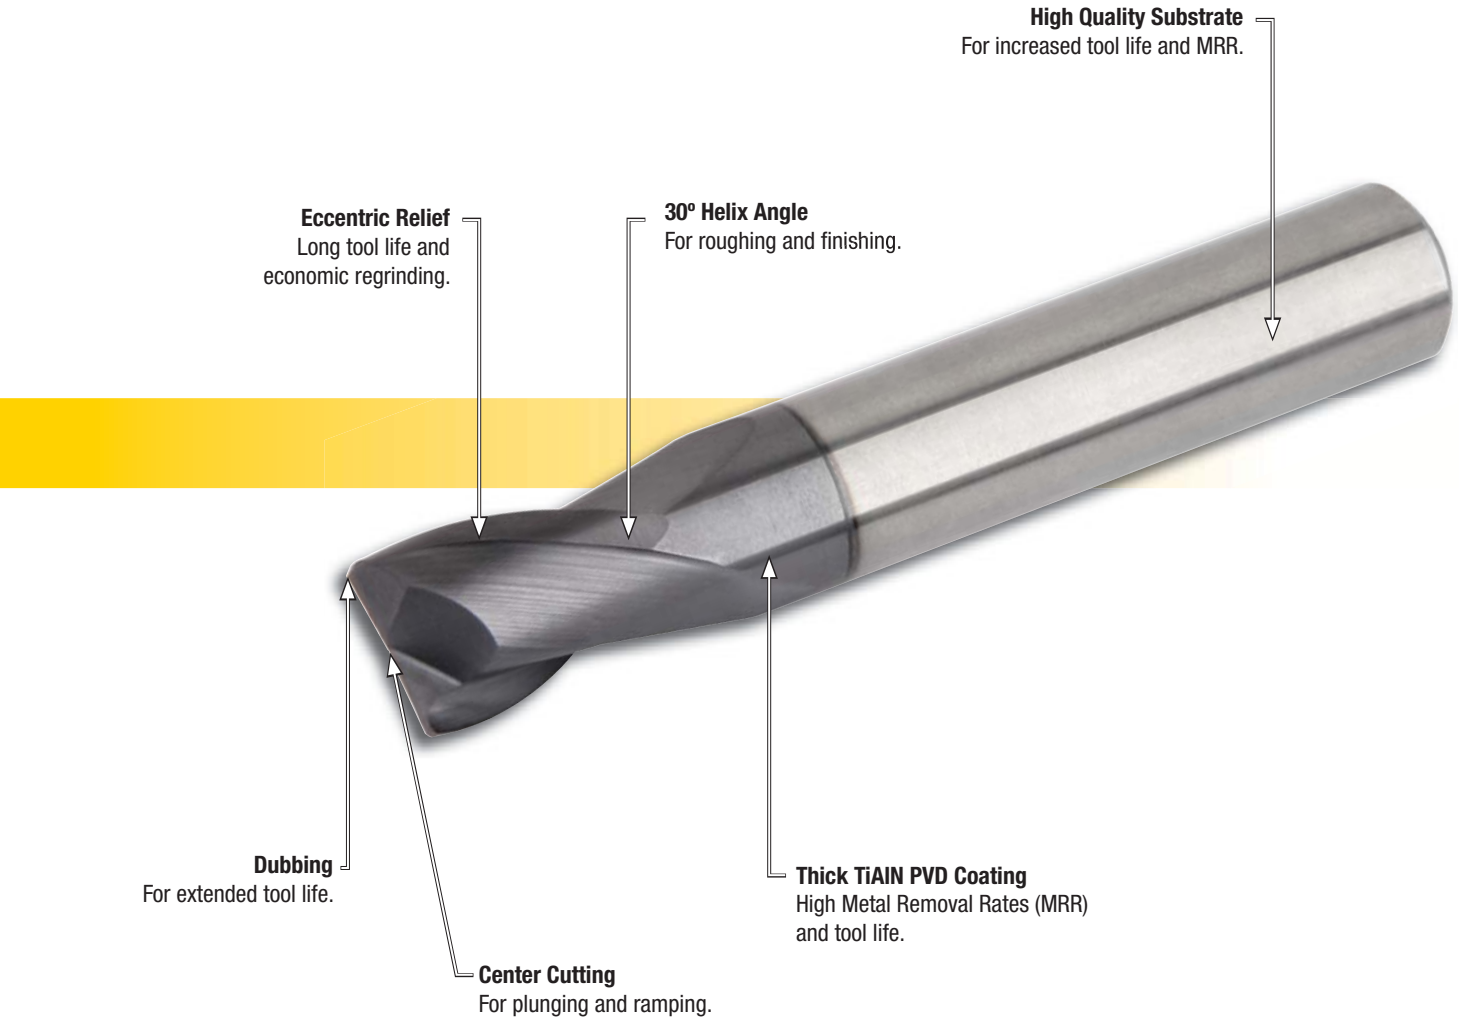
Features and Benefits

Advanced Technology

- Roughing and finishing with one tool reduces tool changes and unnecessary tooling inventory.
- Eccentric relief increases edge stability for longer tool life and better surface quality.
- Eccentric relief eases regrinding and reduces reconditioning cost.
- 2-flute design for unstable conditions and high flexibility.

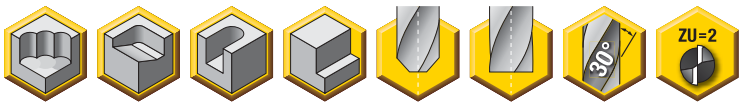
Tailored Grades

- Universal multilayer KC633M coating for cutting steel, cast iron, and stainless (wet).

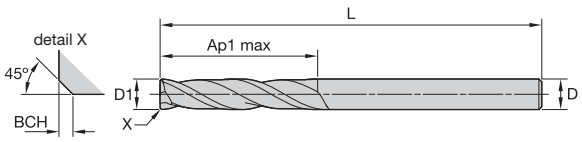


Customization

- Intermediate diameters available.



Extensive Standard Offering



- Diameter range 1/64–1".
- Sharp edge, chamfer edge, and ball nose as standard offering.

Designed for roughing and finishing with one tool at a value price.

- Center cutting.

NOVO KNOWS CAD/CAM

With the addition of NOVO™ applications to your team, your CAD/CAM capabilities become much more accurate, streamlined, and productive.

Before NOVO: The programmer would be in their CAD/CAM software, programming a part. Using the tedious method of finding a tool in a catalog, and then manually inputting the tooling information from the catalog into the CAD/CAM software.

The concern is that assumptions are made, and only partial tooling information is entered.

With NOVO: The powerful digital intelligence of NOVO applications not only help the programmer find the right tool for the metalcutting job, but also automatically integrates all the tooling data into a complete CAD/CAM solution. The integration of all the tooling data increases the viability of the part being programmed, and is delivered quickly — saving you time.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximizes every shift. **kennametal.com/novo**

GOmill™ GP General Purpose Solid Carbide End Mills · 3 Flute

Primary Application

GOmill GP system offers plunging, slotting, and profiling with long tool life on a wide range of materials. Designed to provide high Metal Removal Rates (MRR) and to achieve good surface conditions at excellent cost-benefit ratio. A wide range of diameters and lengths with sharp edge are available from stock.

- Roughing and finishing with one tool.
- Excellent cost-benefit ratio.
- Multilayer KC633M™ grades for long tool life.

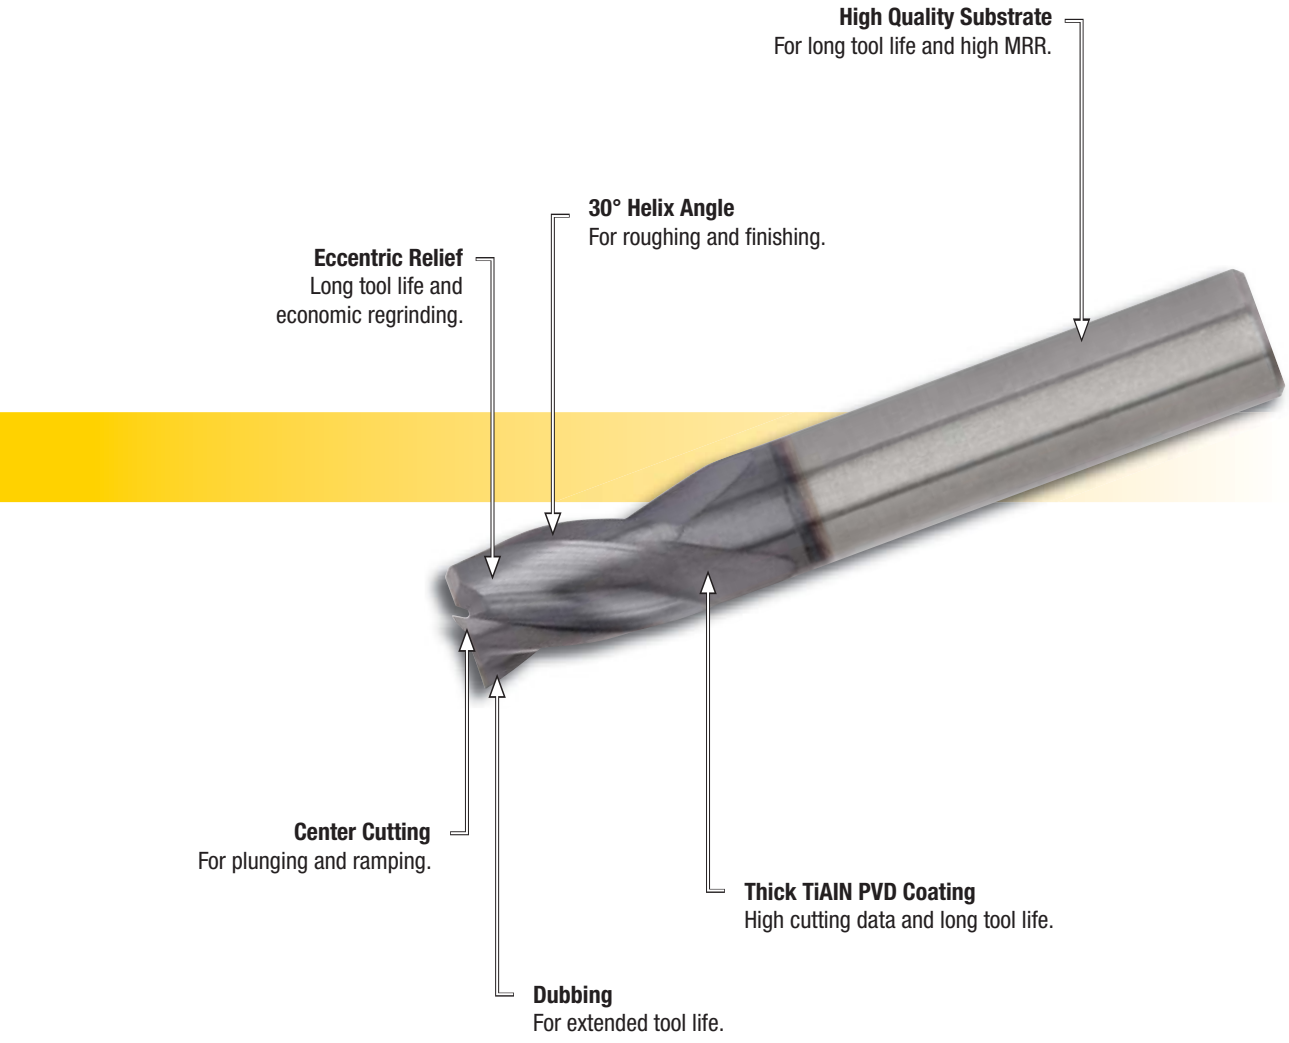
Features and Benefits

Advanced Technology

- Roughing and finishing with one tool reduces tool changes and unnecessary tooling inventory.
- Eccentric relief increases edge stability for longer tool life and better surface quality.
- Eccentric relief eases regrinding and enables higher flexibility and lower reconditioning cost.
- 3-flute design for maximum manufacturing flexibility.

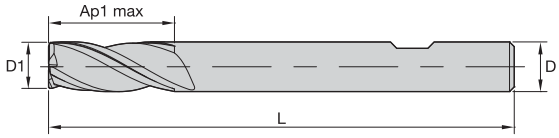
Tailored Grade

- Universal multilayer KC633M coating for cutting steel, cast iron, and stainless steel (wet).



Customization

- Intermediate diameters available.

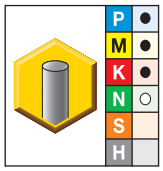


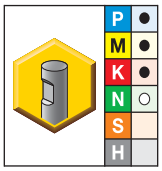
Extensive Standard Offering

- Diameter range 1/32–1".
- Sharp edge as standard offering.
- Four different lengths as factory standards in stock.

Designed for roughing and finishing with one tool at an economical price.

- Center cutting.





End Mill Tolerances

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on diameters >1/2".

GOmill™ GP General Purpose Solid Carbide End Mills · 4 Flute

Primary Application

GOmill GP system offers plunging, slotting, and profiling with long tool life in a wide range of workpiece materials. These end mills are designed to provide high Metal Removal Rates (MRR) and to achieve good surface quality at an excellent cost-benefit ratio. A wide range of diameters and lengths are available with chamfered edge and ball nose as stocked standard.

- Roughing and finishing with one tool.
- Excellent cost-benefit ratio.
- Multilayer KC633M™ grades for long tool life.

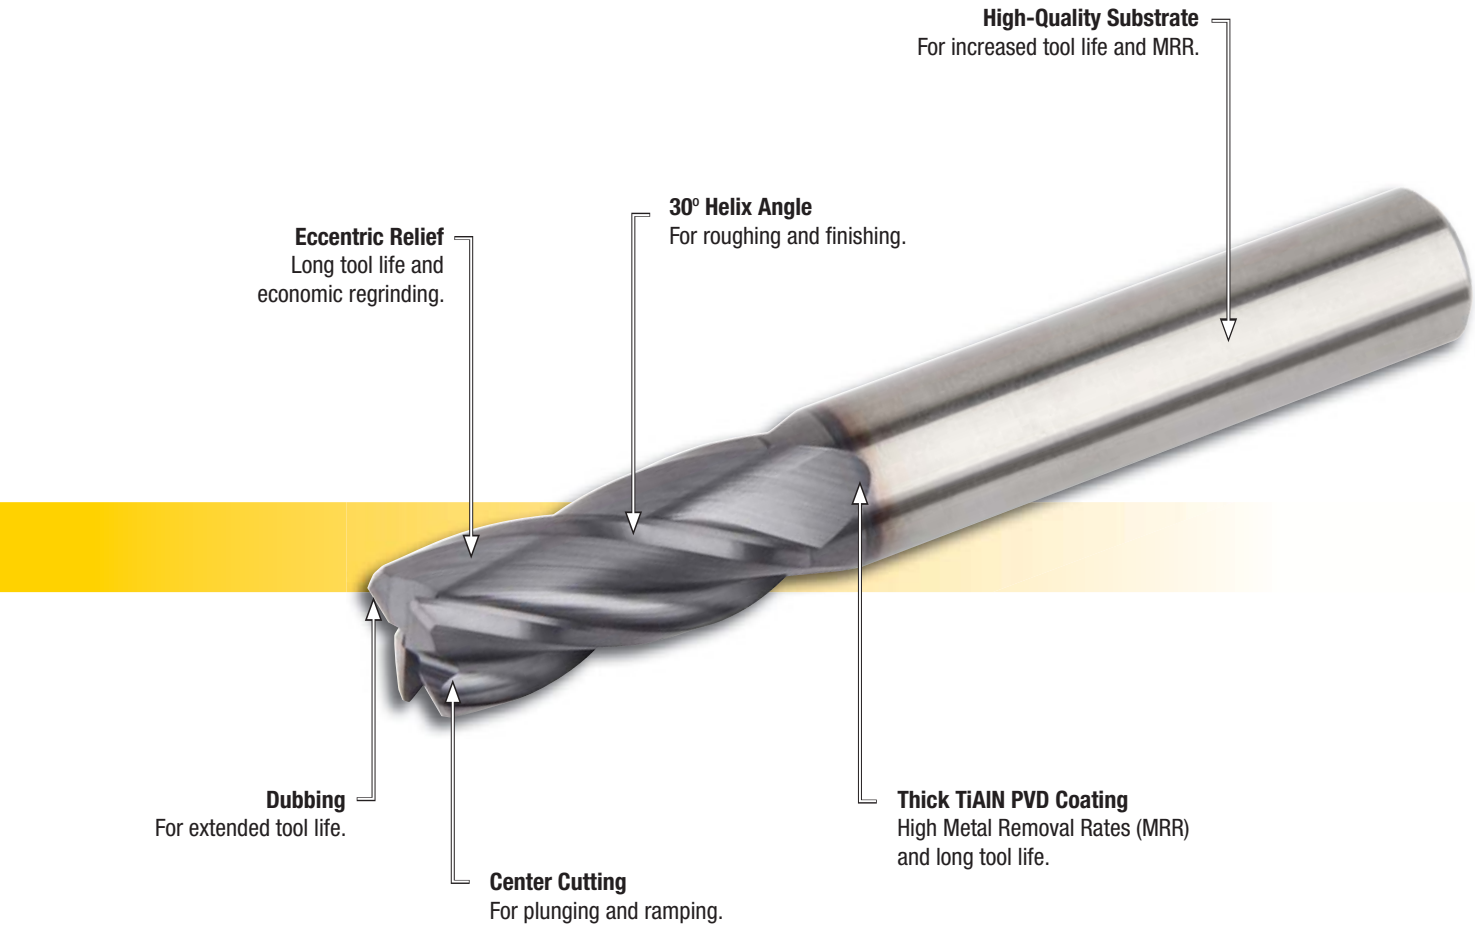
Features and Benefits

Advanced Technology

- Roughing and finishing with one tool reduces tool changes and unnecessary tooling inventory.
- Eccentric relief increases edge stability for longer tool life and better surface quality.
- Eccentric relief eases regrinding and reduces reconditioning cost.
- 4-flute design for high MRR and reduced machining time.

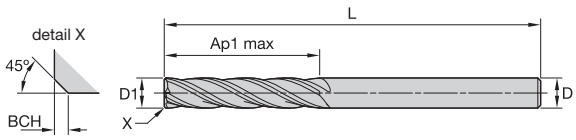
Tailored Grades

- Universal multilayer KC633M coating for cutting steel, cast iron, and stainless steel (wet).

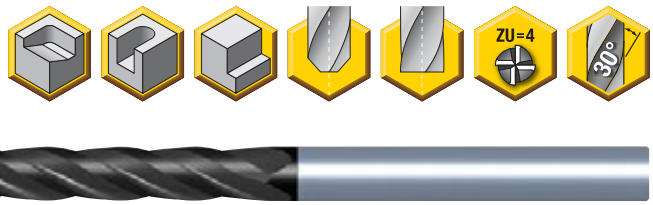


Customization

- Intermediate diameters available.



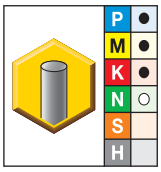
Extensive Standard Offering

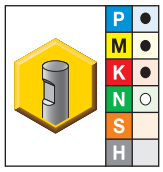


- Diameter range 1/64–1".
- Sharp edge, chamfer edge, and ball nose as standard offering.

Designed for roughing and finishing with one tool at a value price.

- Center cutting.





End Mill Tolerances

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centers, please adjust parameters accordingly on >1/2" diameter.

How Do Catalog Numbers Work?

Each character in our catalog number signifies a specific trait of that product. Use the following key columns and corresponding images to easily identify which attributes apply.

3	SE	0250	IR	075	A
Number of Flutes	End Mill Shape	Cutting Diameter inch	Standard	Ap1 max inch	Shank Style
2 = 2 Flute **3** = 3 Flute **4** = 4 Flute	**CH** = Chamfer Edge **BN** = Ball Nose **SE** = Sharp Edge		**IS** = Factory Standard Short **IR** = Factory Standard Regular **IL** = Factory Standard Long **IX** = Factory Standard Extra Long		**A** = Plain Shank **B** = Weldon® Shank

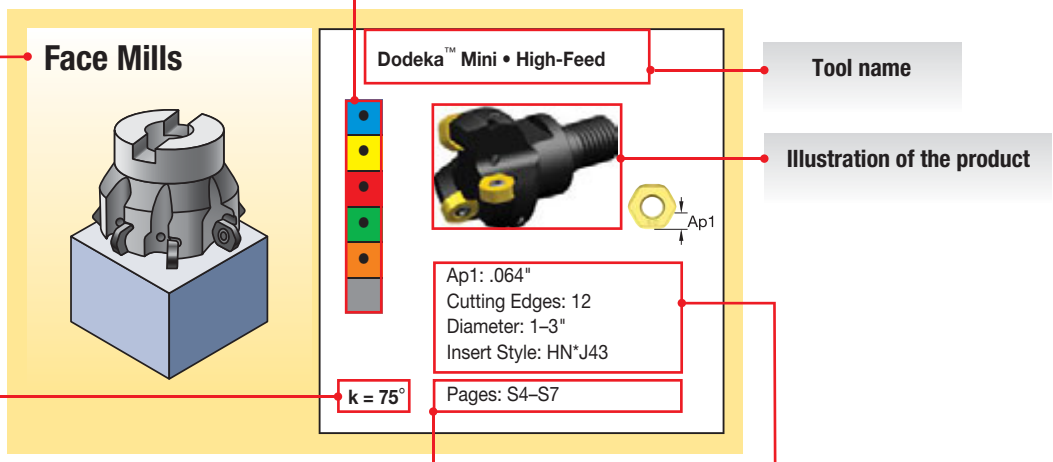
The Most Advanced Milling Solutions in the Industry

For unsurpassed quality, value, and performance, you can trust Kennametal to provide the most comprehensive line of reliable metalcutting tools. Whatever your indexable milling product requirements, be assured that you will find the appropriate solution in this all-inclusive, easy-to-use guide.



For every milling application, workpiece, or equipment need, we offer the best tools on the market, designed to reduce your machining time, provide superior surface finishes, and exceed your expectations!

Identify material to be machined:
Each tool has a material grid marked with a letter indicating the materials that can be machined.

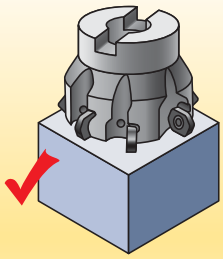
● first choice
○ alternate choice

P	○	Steel
M	●	Stainless Steel
K		Cast Iron
N		Non-Ferrous
S	○	High-Temp Alloys
H	○	Hardened Materials

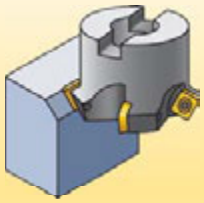
Choose your application:
- Face Milling
- Chamfer Milling
- Shoulder Milling
- Slotting
- Copy Milling
- Ceramic Milling
- Thread Milling

Tool name

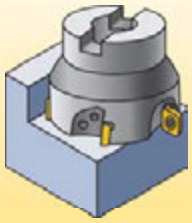
Illustration of the product



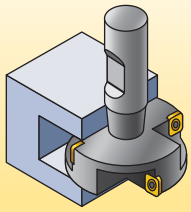
Lead angle



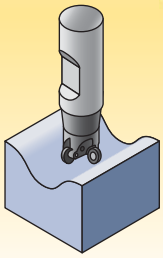
Location of introduction detail, tool bodies, inserts, and cutting data.



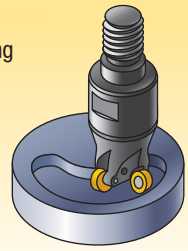
Select tool based on maximum depth of cut and diameter required:
Information is given in this area to provide specific detail as a quick reference.



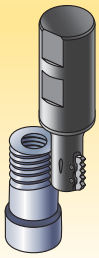
How to Navigate the 2018 Catalog



Step 1 • Select Application



Face Milling

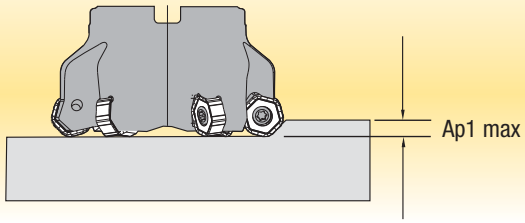


Chamfer Milling

Shoulder Milling (End Milling)

Slotting

Copy Milling

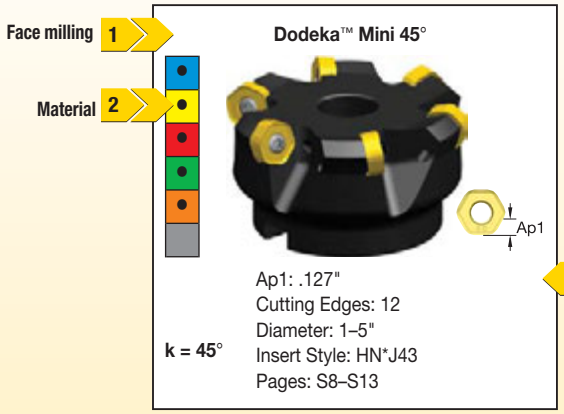


Ceramic Milling

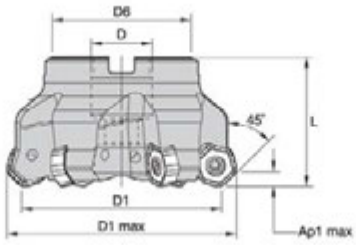
Thread Milling

Step 2 • Select Workpiece Material

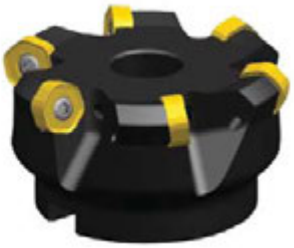
ISO Description		● first choice ○ alternate choice	Material Group	
Steel	P	●	P1–P2	Carbon steels
			P3–P4	Alloy steels and tool steels
			P5–P6	Ferritic, martensitic, and PH stainless steels
Stainless Steel	M	●	M1–M2	Austenitic stainless steels
			M3	Duplex stainless steels (ferritic and austenitic mixture)
Cast Iron	K		K1–K2	Gray, ductile, CGI, and malleable cast irons >80 KSI
			K3	Ductile, CGI, and malleable cast irons >80 KSI
Non-Ferrous Materials	N		N1–N2	Aluminum alloys <12.2% Si
			N3	Aluminum alloys >12.2% Si
High-Temp Alloys	S	●	S1–S2	Iron- and cobalt-based heat-resistant alloys
			S3	Nickel-based heat-resistant alloys
			S4	Alpha-Beta titanium alloys
Hardened Materials	H	○	H1	Hardened steels and irons



Step 3 • Select a Maximum Axial Depth of Cut (Ap)



(continued)



How to Navigate the 2018 Catalog *(continued)*

Step 4 • Select Milling Cutter from Application Selector

Select the Cutter

Dodeka Mini 45° • Shell Mills

How to Navigate the 2018 Catalog *(continued)*

Step 6 • Insert Chart, Providing the Inserts and Grades

HNPJ-GD

catalog number	D	BS	L10	Rε	S	hm	cutting edges	K313	KC410M	KC510M	KC520M	KC522M	KC725M	KCK15	KCPK30	KCPM40	KCSM40
HNPJ43ANSNGD	.472	.057	.254	.039	.175	.003	12	–	–	–	●	●	●	●	●	●	●

Step 7 • Defining the Feed per Tooth

Geometry (S.GD)
20% radial width of cut, follow arrows for value.
% = radial width of cut (Ae) ÷ cutter diameter (D1)
Using a round or ball nose insert, consider the axial depth of cut; see separate chart on the cutter page.

Recommended Starting Feeds [IPT]

	Light Machining	General Purpose	Heavy Machining

Insert Geometry	Programmed Feed per Tooth (fz) as a % of Radial Depth of Cut (ae)															Insert Geometry
	10%			20%			30%			40%			50–100%			
F..LDJ	.005	.010	.019	.004	.007	.014	.003	.006	.012	.003	.006	.012	.003	.006	.011	F..LDJ
E..LD	.005	.014	.029	.004	.011	.021	.003	.009	.019	.003	.009	.017	.003	.008	.017	E..LD
S..GD	.010	.022	.038	.007	.016	.028	.006	.014	.024	.006	.013	.022	.006	.013	.022	S..GD
S..HD	.010	.024	.039	.007		.029	.006	.015	.025	.006	.014	.023	.006	.014	.023	S..HD

NOTE: Use "Light Machining" values as starting feed r

7

7

Always consider starting with the "Light Machining" value. Once established, increase the feed per tooth from the chart.
These are minimum values and can be increased when the application has been proven.
Light Machining — Low Feed Rate, High Speed
General Purpose — Normal Feed, Normal Speed
Heavy Machining — Higher Feed, Reduced Speed

Step 8 • Recommended Starting Speeds [SFM]

8

8

Material Group		SC6525			SP4019			SP6519			KCSM30			KCSM40			X400

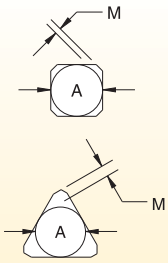
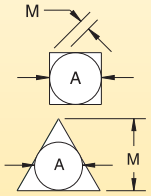
How Do Catalog Numbers Work?

Each character in our catalog number signifies a specific trait of that product. Use the following key columns and corresponding images to easily identify which attributes apply.



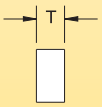
H — Insert Shape

A	Parallelogram	85°
C	Rhomboid	80°
E		75°
H	Hexagon	120°
L	Rectangular	90°
O	Octagon	135°
R	Round	—
S	Square	90°
T	Triangular	60°
X	Kennametal Standard Form	



N — Insert Clearance Angle

A	3°
B	5°
C	7°
D	15°
E	20°
F	25°
G	30°
N	0°
P	11°



G — Tolerance Class

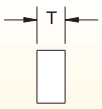
Indexable inserts with facets/wipers

Indexable inserts with corner radii

Insert thickness

J — Geometry and Clamping Type

5 — Size



A	symbol
1.000	8
.750	6
.625	5
.500	4
.375	3
.250	2

inscribed circle "A"

For shapes A, L, and X, see position #1; use length of leading cutting edge in increments of 1/4".

3 — Thickness

insert thickness

Grades

Coating	Grade Description	wear resistance ↔ toughness: 05	10	15	20	25	30	35	40	45
GH1	Uncoated submicron carbide grade with high wear resistance. GH1 is suitable for machining of aluminum and non-ferrous materials. Also a good choice for the finishing of cast iron. This grade can be used both wet and dry and is designed for light and general machining.	K, N	K, N	K, N						
GH2	Uncoated, fine grained carbide grade with good strength. GH is suitable for machining of aluminum and non-ferrous materials. Also good choice for cast iron for medium toughness requirements. This grade can be used both wet and dry and is designed for light and general machining.				K, N, S	K, N, S	K, N			
K110M	Uncoated carbide grade K110M is a universal grade for machining non-ferrous material. For use in light and general machining. K110M can be used with or without coolant.		K, N, S	K, N, S	N					
K115M	Uncoated carbide grade. K115M is a premium uncoated grade designed for high edge-wear resistance in non-ferrous and cast iron materials. Recommended to be used with coolant.	K, N	K, N	N						
K313	Uncoated carbide grade. K313 is suitable for machining cast iron, high-temperature alloys and non-ferrous materials. This grade can be used both wet and dry and is designed for light and general machining.	K, N, S	K, N, S	K, N						
KBK50	A high CBN content, PcBN tip brazed onto a carbide insert. Designed to machine at highest speeds and tool life on semi-finishing and finishing cast iron materials.	K	K	K						
KC410M	PVD, TiB_2 coating on grade KC410M is extremely hard and provides very good wear characteristics at higher cutting speeds. KC410M resists built-up edge, can help reduce burring, and generates excellent surface finishes. The grade is best suited for aluminum with <10% silicon and other non-ferrous materials.	N	N	N						

Coatings provide high-speed capability and are engineered for finishing to heavy roughing.

wear resistance ← → toughness

Grades

Coating	Grade Description		05	10	15	20	25	30	35	40	45
KC422M	The PVD TiB_2 coating is very wear resistant. Together with hard coating and a tough substrate, this is an excellent combination for medium to roughing applications in aluminum <10% silicon and other non-ferrous materials.	N									
KC505M	Coated carbide with PVD TiAlN. KC505M is a highly wear-resistant grade primarily used for light maching applications in steel and hardened steels.	P									
		H									
KC510M	Coated carbide grade with a TiAiN coating (PVD). KC510M is a highly wear-resistant grade primarily for use in milling aluminum and high-temperature alloys in light applications. Can also be used for machining of steel and hardened steel.	P									
		N									
		S									
		H									
KC514M	Coated carbide grade with a thicker PVD TiAlN coating. KC514M combines high wear resistance with good toughness. Primarily for light to medium machining of cast irons. This grade can be used both wet and dry.	K									
KC515M	Premium-coated grade K10 substrate with built-in wear resistance and (TiAlN) coating for extended life during finishing applications. Used in finish ball nose and back draft inserts for the die and mold industry. Capable of running at moderate to high cutting speeds.	P									
		M									
		K									
KC520M	Coated carbide grade with TiAlN coating (PVD). KC520M is a carbide grade developed specifically for general machining of ductile cast iron. This grade can be used with or without coolant.	K									
KC522M	Coated carbide grade with a AlTiN (PVD) coating. KC522M is engineered to provide better performance in general machining of high-temperature alloys and stainless steel. KC522M resists breakage and offers improved wear resistance and increased strength.	P									
		M									
		K									
		S									

Coatings provide high-speed capability and are engineered for finishing to heavy roughing.

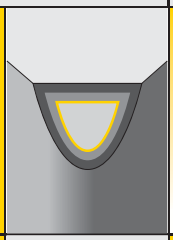
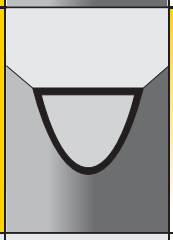
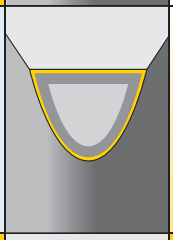
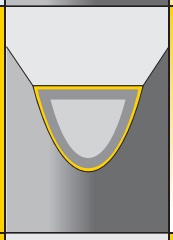
Grades

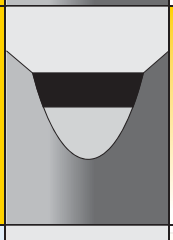
Coating	Grade Description		05	10	15	20	25	30	35	40	45
KC524M	Coated carbide grade with a thicker PVD TiAlN coating. KC524M combines good wear resistance with high toughness. Primarily for general machining of all cast irons. This grade can be used both wet and dry.	K									
KC525M	Coated carbide grade with a TiAlN coating (PVD). New universal carbide grade for milling steel, stainless steel, and high-temperature alloys. KC525M can be used with or without coolant. Primarily for use in light and general machining.	P, M, S									
KC530M	Premium PVD-coated carbide grade (P40) with a TiAlN coating. Enables extended tool life at moderate feeds and high cutting speeds. First choice for milling in all steels, including die and mold steels. Recommended for use without coolant.	P, M									
KC725M	Coated carbide grade with an advanced PVD TiAlN coating. KC725M is a high-performance grade for milling steel, stainless steel, and ductile cast iron. The good thermal shock resistance of the substrate makes this grade ideal for both wet and dry machining. Primarily for use in general and heavy machining.	P, M, S									
KC735M	PVD/TiN coated carbide grade. This grade offers an unusual combination of high toughness and wear resistance. Even under extreme toughness requirements, it achieves outstanding results in general and heavy-machining applications. Suitable for dry and wet machining.	P, M									
KCK15	Coated carbide grade with CVD multilayer coating (TiN/MT TiCN/Al_2O_3) and advanced Beyond™ post-coat treatment. KCK15 is a wear-resistant grade with balanced toughness for general milling of cast irons at higher speeds. Best results in dry, but can also be used wet.	K									
KCK20	A new PVD multilayer AlTiN + AlCrN coated carbide with an excellent combination of wear resistance and coating strength. The KCK20 grade is specifically engineered to maximize coating adhesion and edge strength, making this grade ideal in wet interrupted cutting of gray and ductile irons, and can also be used in dry conditions. It can be used in a wide range of applications, from finishing to roughing, to maximize productivity wherever strength and reliability are needed.	K									

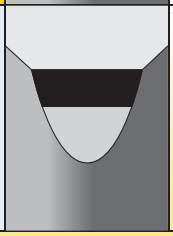












Coatings provide high-speed capability and are engineered for finishing to heavy roughing.

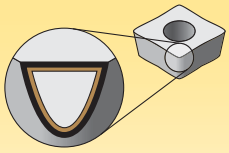
Coating		Grade Description		05	10	15	20	25	30	35	40	45
KCPK30		Coated carbide grade with CVD multilayer (TiN/TiCN/Al_2O_3) and advanced Beyond™ post-coat treatment. Substrate is very tough. KCPK30 has a wide application area in general and roughing milling of steels and cast irons. Performs best dry, but can also be used wet.	P					■	■	■	■	
			K					■	■	■	■	
KCPM40		Coated carbide grade with an advanced PVD TiAlN/AlCrN coating. Tough substrate with excellent capability at higher temperatures. KCPM40™ is the first choice for milling steel and stainless steel. Good thermal shock resistance makes this grade ideal for both wet and dry machining. Primarily for use in general and heavy machining.	P					■	■	■	■	
			M					■	■	■	■	
KCSM30		Submicron substrate coated with high-performance TiAlN-PVD coating is an excellent choice for titanium, but also high-temperature alloys and stainless with higher speeds for light to medium cuts. First choice for application with thin to medium chip thickness, dry and wet.	P				■	■	■			
			M					■	■	■		
			S				■	■	■	■		
KCSM40		Coated carbide grade with an advanced PVD TiAlN/TiN coating. Premium substrate with newly developed binder composition. KCSM40 is a high-performance grade for titanium, super alloys, and stainless steel. High thermal shock resistance of the substrate makes this grade ideal for wet machining. First choice for roughing and unsuitable cutting conditions.	M					■	■	■	■	
			S					■	■	■	■	
KD1400		A PCD-tip brazed to a carbide carrier for high-speed machining of non-ferrous materials. KD1400 has excellent chipping resistance with good wear characteristics. Coolant is preferred.	N	■	■	■						
KD1410		A PCD-tip brazed to carbide for machining aluminum with a very high silicon content, abrasive non-ferrous materials, and fiber-reinforced plastics. KD1410 can be used at very high cutting speeds, even where good surface finishes are required. This grade can be used both wet or dry but is suggested to use coolant where good surface finishes are required.	N		■	■						



Coatings provide high-speed capability and are engineered for finishing to heavy roughing.

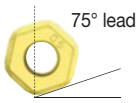
Dodeka™ Series

Leader in Advanced Face Milling Applications

Primary Application

Dodeka Mini, Dodeka, and Dodeka MAX™ platform face milling boosters are the most comprehensive face milling boosters on the market today. Twelve true cutting edges per insert mean low cost-per-edge and high productivity. With Beyond™ premium milling grades, achieve up to 30% higher metal removal rates (MRR), 25% lower cutting forces due to soft cutting action, and up to 35% better tool life in light to heavy machining.

Features and Benefits

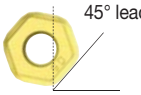


Dodeka Series • Most comprehensive face milling platform on the market. Providing an excellent cost-per-cutting edge with market leading performance. The Dodeka Series platform will cover all your face milling application needs.

All cutter body variations can be loaded with one insert style.

Dodeka Mini High-Feed 75°
Dodeka High-Feed 75°

12 True Cutting Edges



Dodeka Mini	**Ap1 max = .065"**
Dodeka	**Ap1 max = .087"**

Dodeka Mini HF and Dodeka HF can be loaded with all Dodeka Mini standard inserts, except wiper inserts.

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- High feed rates for rough face milling.
- .08" depth-of-cut capability.
- Twelve cutting edges per insert.

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Twelve cutting edges per insert.
- Through-coolant on cutters <4.0" diameter. 5.0" diameter cutters and above do not have through-coolant.
- Soft cutting action.

Solution Capabilities

SCREW-ROTOR MILLING

Kennametal customers benefit from the highest service levels, our long-term experience, and application knowledge in milling of screw-rotors.

- Faster availability due to standardized processes for custom-made inserts.
- Solutions for all machines currently on the market.
- Very close contour profile with standardized profile inserts for minimum grinding allowance.
- Tools can be used in many different materials.
- Increased productivity through application-specific strategies for optimized milling.
- Smooth cutting action due to multiple rows of different insert alignments for optimum performance.
- Innovative solutions for small rotors with demanding profiles.

Experience the advantages at your Authorized Kennametal Distributor or at **kennametal.com**.

Mill 16™

Face Mills for Cast Iron Machining.

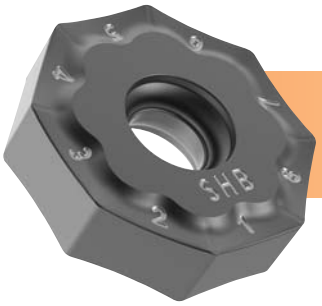
Screw-On Clamping

Wedge Clamping

Features

- 16 effective cutting edges per insert.
- Ap1 max = .216" (5,5mm).
- Coarse, medium and fine pitch cutters.
- Cutter bodies with pocket seat numbering system.
- Cutter diameter range = 1.969–9.843" (50–250mm).
- High-precision periphery ground inserts.
- Inserts with cutting edge numbering system.
- Lower cutting forces.
- Clearance on second main cutting edge.

Benefits

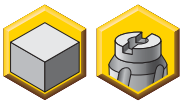


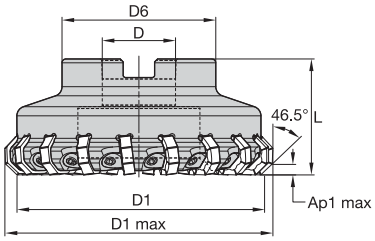
- Low cost per edge to cut cost per part (CPP).
- Perfect fit for most cast iron face milling requirements.
- High feed rates to boost productivity and reduce cycle time.
- Comprehensive standard offering to address most needs of the shop floor.
- Improved axial runout and tool life.
- Very smooth cutting action and lower cutting forces.
- Orientated edge positioning to support axial and radial runout.
- Reliable cutting above Ap1 = .216" (5,5mm) addresses castings with varying skin thickness.

Primary Application

The new Mill 16™ series is a specially-made platform for rough milling of components like engine heads and blocks, housings and gear boxes in cast iron materials (CGI, DCI, GCI), and all other cast iron face milling jobs. Best-in-class for machining CGI materials.

Split Case Design





Innovative insert design to reduce cutting forces and increase productivity at lower cost per edge.

- Semi-finishing and light machining
- Medium roughing
- Heavy roughing

- Productivity booster for machining cast iron materials.
- Insert with 16 cutting edges.

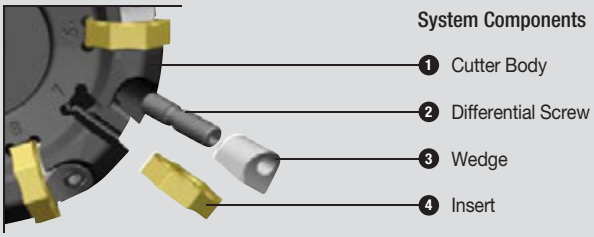
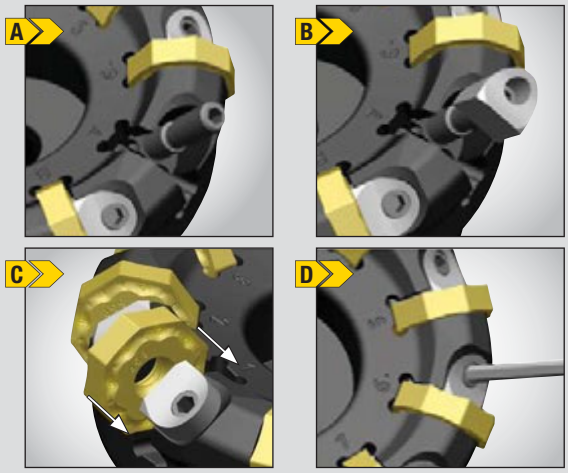
NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

User Information

- Only use with indexable inserts ONPX0806**/ONGX0806** (ONPX64**/ONGX64**).
- Only use original Kennametal spare parts as per the current catalog.



- Maintenance and repair of cutters should only be carried out by Kennametal.
- The tools must only be used in combination with suitable tool adapters and machine spindles.
- Use only the recommended torque settings when assembling the cutters for use. For further information contact the KMT CAS Team.



* These assembly instructions relate only to the Kennametal Mill 16 Face Mill family and not to its connection to a spindle or spindle adapter.

Preparation

- Prior to use, ensure the cutter is thoroughly cleaned and remove all dirt, grease, and anti-corrosive protection.
- Carefully grease the differential screws with copper grease. Ensure the rest of the cutter is clean.
- When loading the inserts into the cutter, please ensure that they are inserted in the clean pocket seat in the correct position.
- Mounting position: The flat side of the clamping wedge sits on top of the insert face. We recommend to mount the inserts by following the insert's edge numbering system for orientated insert seating. Active cutting edges shall all have the same cutting edge number.

Insert Clamping and Adjusting

Pre-setting of Inserts

A. Screw the differential screw ❷ into the cutter body ❶ by approximately 2 turns using a 3mm hex wrench.

B. Place wedge ❸ on differential screw ❷ and fasten into the cutter body.

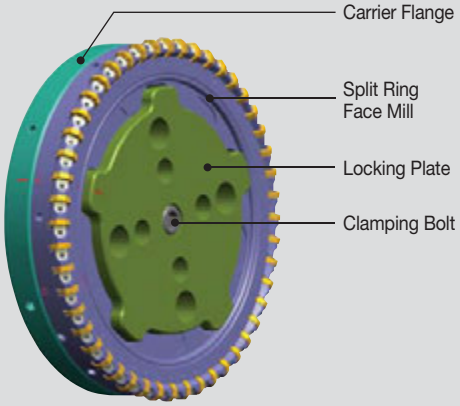
C. Push insert ❹ into the pocket seat by hand in the direction shown.

D. Clamp insert ❹ with wedge ❸ by rotating the differential screw with a clamping force of MA = 18 in/lbs (2 Nm). The differential screw must not stick out of wedge.

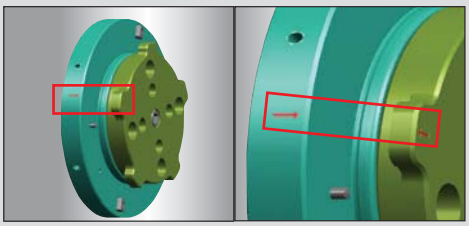
E. Repeat steps A–D for all inserts.

Tightening the Inserts

F. Tighten all inserts of the pockets with the wedge using the differential screw with a clamping torque of MA = 62 in/lbs (7 Nm).

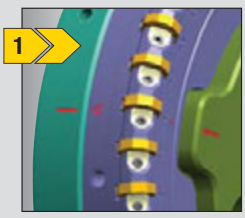


Split Cutter Assembly Instructions



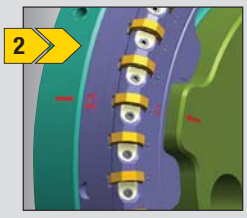
Please read and follow the instructions below for safe and productive application.

User Information



These assembly instructions relate only to Kennametal split-case milling cutters and not to its connection to a spindle or spindle adapter.

System Components



Initial position must be in such a way that the arrows in the carrier flange and locking plate coincide with each other.

Place the split ring face mill over the carrier flange in such a way that arrows in the locking plate and carrier flange coincide with the marking "A" in the cutter.

Turn the cutter ring clockwise from marking "A" to marking "B".

Tighten the clamping bolt with a torque of 100 Nm.

Extended Kennametal Service

Adjustable Torque Wrenches

When working with inserts, it is especially important to use the correct torque. Kennametal offers extended service levels by assuring best tightening with adjustable torque wrenches. Please order separately as needed.

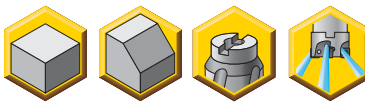
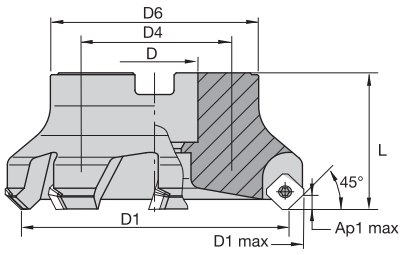
KSSM™ 45°



Universal face mill for conventional machining.



Features and Benefits

- Insert SE.T1404.
- Ap1 max = .260".
- Four true cutting edges.
- Pocket seat protection with carbide shims.
- Easy handling and rapid insert change.

- Consumes less power.
- Rapid insert changes.

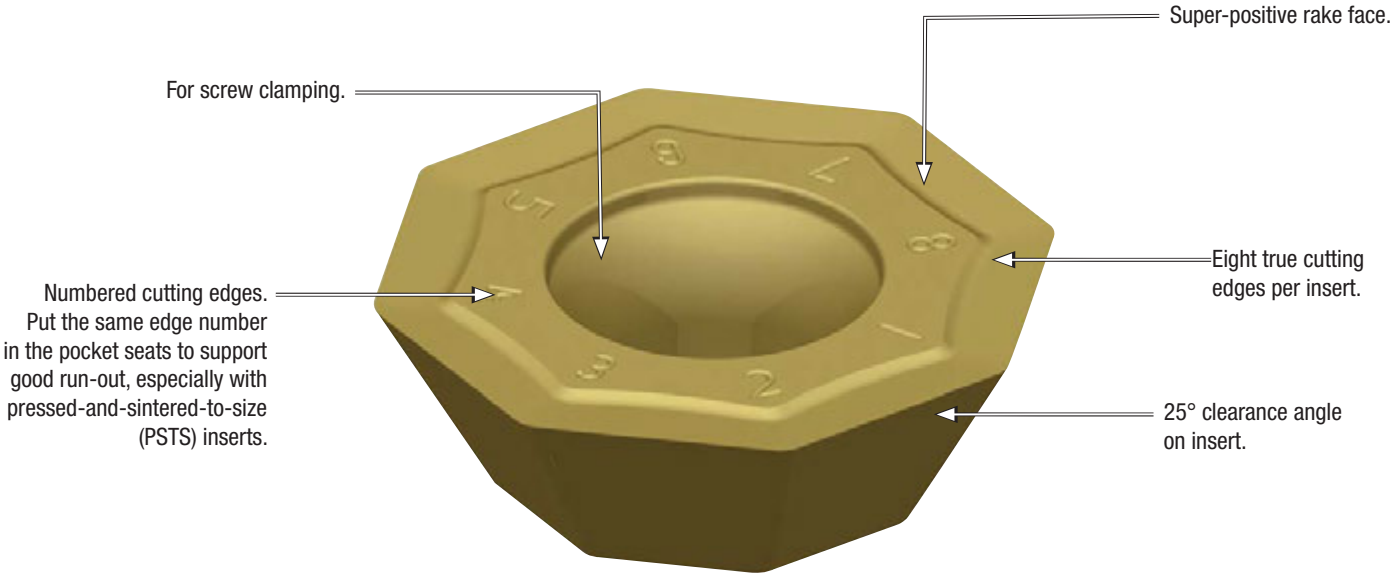
KSOM™ Mini • KSOM Milling Tools

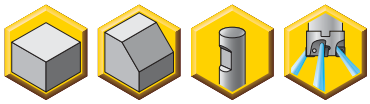


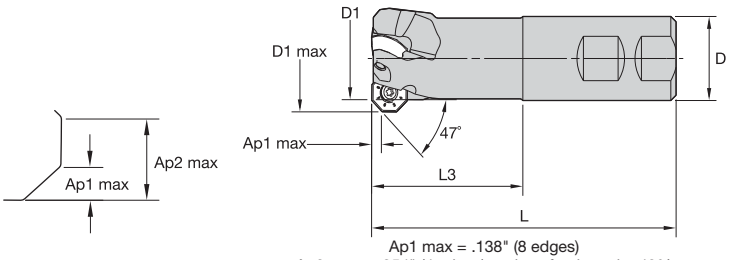
Primary Application

High-positive face mills with eight cutting edges for use in most workpieces materials. Due to its design, face milling, plunging, helical interpolation, and ramping are possible with KSOM mills.

Features and Benefits

- Super-positive rake face for soft cutting action.
- Low cutting forces deliver higher feed capability.
- 25° clearance angle on insert allows excellent free cutting.
- Excellent performance in stainless steel and super alloys.
- First choice solution for machining turbocharger materials like 1.4826, 1.4838, 1.4848, and 1.4849.





KSOM Mini: insert OF*T53
— Ap1 max = .138" (8 indexes)
— Ap2 max = .354" (4 indexes)

KSOM insert OF*T64
— Ap1 max = .197" (8 indexes)
— Ap2 max = .461" (4 indexes)

- Eight cutting edges per insert.
- Super soft cutting.

Ap1 max = .138" (8 edges)
Ap2 max = .354" (4 edges); reduce feed rate by 40%

KSSM8+™ Face Milling Platform

Primary Application

The KSSM8+ platform is a first-choice face milling platform for **versatility** and a **reduced cost per edge**. This platform just got better with the latest pressing technology from Kennametal, which delivers pressed and sintered-to-size (PSTS) inserts ideal for general machining in **cast iron and steel**. With our latest KCPM40™ grade offering, PSTS inserts deliver exceptional performance. Now more than ever, the KSSM8+ platform is the economical solution for applications requiring a **near 0° shoulder**.

Features and Benefits

Features

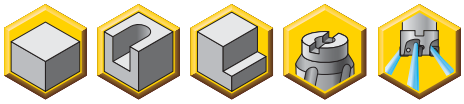
- Double-sided insert with 8 cutting edges.
- Face mill with close to a 0° shoulder.
  - IC 10 (2° lead)
  - IC 12,7 (3° lead)
- Medium and fine density cutters.
- -LD and -GD geometry inserts.

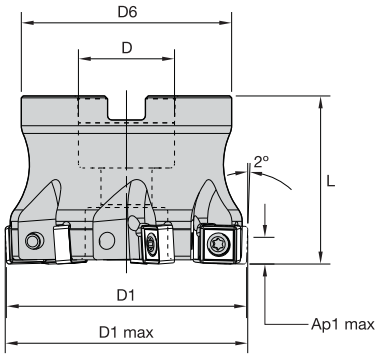
Benefits

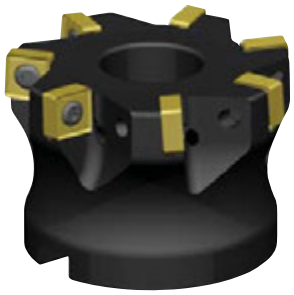
- Maximized number of cutting edges.
- Lower cost-per-edge.
- Reduced power consumption.
- Reduced deformation/chatter.
- Exceptional surface finish.
- Stronger edge for roughing.

Versatile Platform with Multiple Insert Options and Grades

Cost per Edge
Double-sided square inserts,
8 cutting edges.







Optimized Cutting Forces
4° axial and 10° radial rake
angles reduce power consumption.

Through Tool Coolant/Air
Directed to the cutting edge
for optimum cooling.

- Eight cutting edges offer a lower cost per edge.
- Soft cutting action with low cutting forces.

Solution Capabilities

RAIL MILLING

Kennametal customers benefit from the highest service levels, our long-term experience, and application knowledge in the rail milling industry.

- Solutions for all applications in rail and wheel machining.
- Technical support to find the right tools for the application and to learn how to use them the best way.
- Highly productive tooling solutions, including indexable inserts up to eight cutting edges.
- High-performance tools with helix-like partitions and long tool life.
- Solutions available to optimize vibration, performance, and cutting action, depending on the application.

Experience the advantages at your Authorized Kennametal Distributor or at **kennametal.com**.

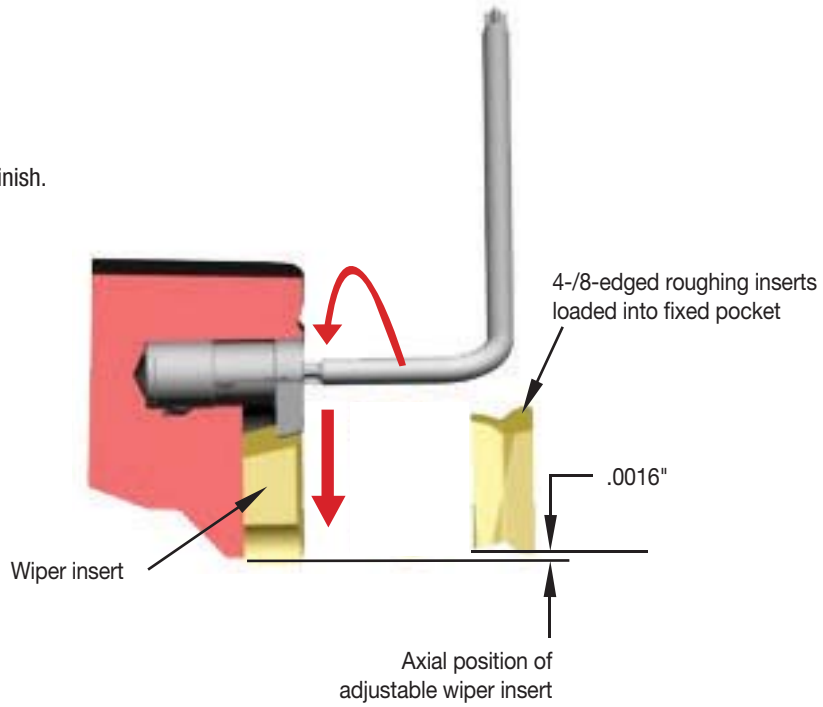
Fix-Perfect™ Cast Iron Rougher and Finisher

Primary Application

Performance booster in machining cast iron materials. Based on workpiece requirements, Fix-Perfect roughers and finishers cover all face and shoulder milling applications when machining cast iron materials with best-in-class productivity. Eight true cutting edges per insert deliver low cost per edge and best cost per part (CPP) ceramic inserts available as standard line items.

Features and Benefits



Fix-Perfect Cast Iron 20° and 0° Roughing and Finishing in One Tool

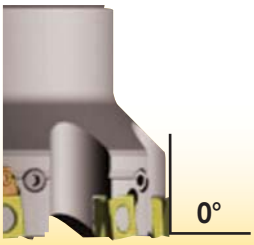
- Innovative tangential insert clamping.
- First choice for high feed rates.
- Protection of non-cutting edges.
- Adjustable element for fine finishing with wiper inserts.
- PCBN-tipped wiper inserts available for excellent floor finish.
- Micro-precise runout setup.

Fix-Perfect Cast Iron *Finisher Best-in-Class Fine-Finishing Concept

- Rigid and stable cutter design.
- High-precision pocket seat.
- Perfect axial runout without insert adjustment.
- Reliable, excellent floor finish and flatness.
- Easy handling and low-cost cutter setup.

*Finisher inch cutters available as custom solution

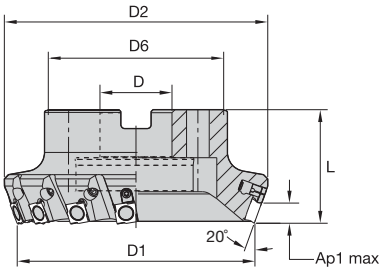
Fix-Perfect™ *Finisher



Fix-Perfect Cast Iron

Fix-Perfect Cast Iron 20º and 0º

Fix-Perfect 20°



Fix-Perfect 0°

*Finisher inch cutters available as custom solution

- Eight cutting edges per insert.
- Rough and finish in one operation.
- Tangential mounted inserts deliver higher feed rates.
- Adjustable pockets (D1 = 3–10").

Ap1max: .232" (8 edges)
Ap2 max: .374" (4 edges); reduce feed rate by 30%

Introduction to Fitting Cutting Bodies

procedures:	roughing		roughing/finishing	
	 fixed pocket	 adjustable pocket	 fixed pocket	 adjustable pocket
1 Reset adjusting element T x T9	–		–	
2 Insert roughing insert Tighten SW 3 M_{An} = 44 in. lbs.				–
3 Tighten adjusting element gently	–		–	–
4 Insert finishing insert and pre-tighten SW 3 M_{VG} = 9 in. lbs.	–	–	–	
5 The finishing insert is positioned .0016" in front of the highest roughing insert	–	–	–	
6 Tighten the finishing insert M_{An} = 44 in. lbs.	–	–	–	

NOTE: This process must be repeated whenever an indexable insert is changed. The ball is loose.

Changing the adjusting element
1. Remove the taper screw①
2. Loosen the SW 1,5 screw②
3. Remove the adjusting element.

ATTENTION: The maximum permissible cutting speed of the milling cutter heads is vc max = 3000 SFM. Only use original parts when clamping the indexable inserts.

Next Generation of HexaCut™

Milling Inserts Are Now Available for Roughing and Semi-Finishing of Cast Iron Materials

Primary Application

The Kennametal HexaCut face milling program is specifically engineered for rough and semi-finish face milling of cast, ductile, and compacted graphite iron. Twelve cutting edges drastically reduce your cost per edge and increase tool life. Shorter setup times and excellent cutter accuracy allow you to apply the HexaCut program to the most demanding jobs. One ceramic and eight carbide grades with six insert geometries deliver high feed rates and will enable you to reach optimum horsepower.

Features and Benefits

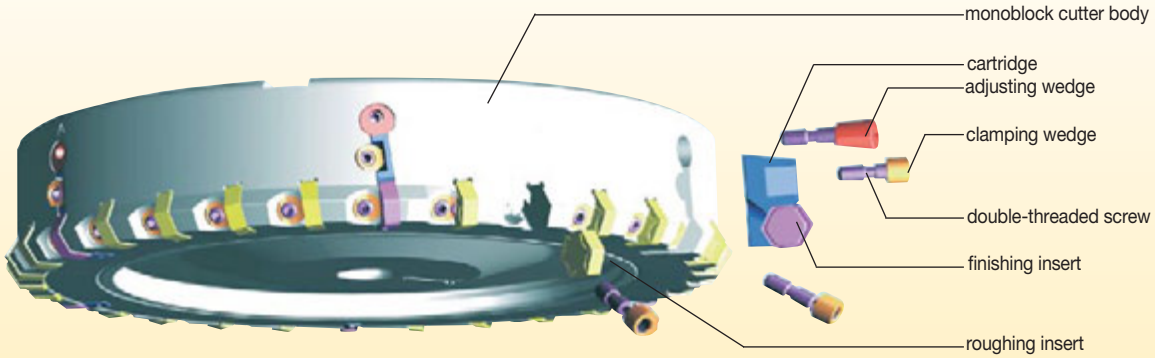
- New insert topographies for existing HexaCut platform with latest cutting edge design.
- Specifically engineered for rough and semi-finish face milling of cast, ductile, and compacted graphite iron.
- Up to 20% better tool life and 10% less power consumption.
- High precision ground on insert IC to achieve a better axial and radial runout.
- First HexaCut roughing insert with integrated wiper facet for better floor finish.

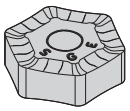
New Standard Insert Offering for HexaCut™ Series

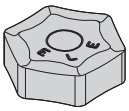
Roughing and semi-finishing of automotive engine blocks and other cast iron face milling operations.

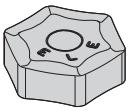
HNHX0905..ENLE
New geometry for semi-finishing and light roughing operations.

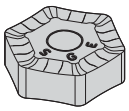
HNHX0905ANSNGE
New geometry for roughing; integrated wiper facet for advanced floor finish.

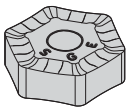


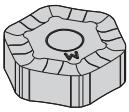


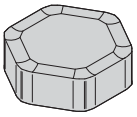












HNHX0905..SNGE
New geometry with improved rake and edge prep design for roughing operations.

HNPX0905..SNGE
New stable geometry for heavy roughing in severe machining conditions.

Please see pages X22–X37 for recommended starting speeds.

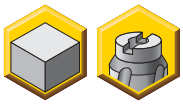
Adjustment Instructions

Before Being Used for the First Time

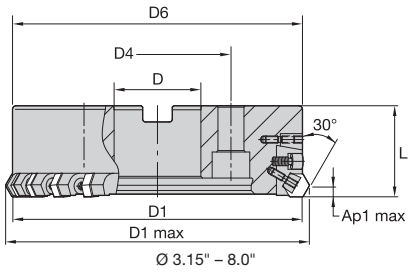
- The milling cutter must be carefully cleaned of anti-corrosive materials, dust, etc.
- The milling cutter should only be washed when all components have been dismantled.
- Only the double-threaded screws of the clamping or adjusting wedge should be lubricated with copper grease; all other components must have clean metallic surfaces.
- A torque wrench is recommended to tighten the double-threaded screws.
- When fitting indexable inserts on the milling cutter, ensure that they are inserted in the correct position in a clean insert seat and that they are held in position during clamping.

For 45° Roughing Mills without Anvils

- The double-threaded screws on the clamping wedges for the indexable inserts are first pre-tightened to approximately 17 in. lbs. and then tightened to a final torque of 62 in. lbs.



ATTENTION



At each tool adjustment, the body, indexable inserts, and spare parts must be checked and replaced, if necessary. Before each tool use, the double-threaded screws of the indexable inserts and the stops must be tightened in the specified order to a torque of 62 in. lbs. In addition, even if the cartridges have not been adjusted, the double-threaded screws of the adjusting wedges must be checked to see if these have been tightened to a torque of 26 in. lbs. If not, they must be re-tightened to this torque.

NOTE: The tools must only be used in accordance with their function. We accept no liability for their improper use. Changes of any kind and/or printing errors are not valid grounds for claims.

- CGI milling solution.
- Monoblock cutter design.
- High feed rates.
- Twelve cutting edges.

Insert setting procedure

This procedure is to be used on all 30° lead roughing/finishing mills using the unmarked roughing cartridge, the finishing cartridge (marked •) and the corrected edge cartridge (marked ▬). These steps must be followed when adjusting the cutters for finishing inserts.

1. Clean all insert pockets.
2. Mount all wedges and cartridges. Torque the cartridge lock wedge screw to 26 in. lbs.
3. Mount all inserts, making sure they are seated properly in the pocket, and torque the insert lock wedge screws to 26 in. lbs.
4. Torque the wedge screws for all fixed pocket inserts to 62 in. lbs.
5. Loosen the cartridge insert wedge screw and the cartridge lock wedge screw.
6. Pressing the insert into the cartridge pocket, adjust the cartridge to .008–.012" below the fixed pocket inserts.
7. Torque the insert lock wedge screw and the cartridge lock wedge screw to 26 in. lbs.
8. Adjust the axial position to .0010–.0015" above the fixed pocket inserts.
9. Loosen the cartridge insert lock wedge screws and then re-torque to 26 in. lbs.
10. Adjust the axial position to the final dimension, .0015–.0020" above the highest fixed pocket insert.
11. Torque the insert lock wedge screws and the cartridge lock wedge screws to 62 in. lbs.
12. Conduct a final check of the axial runout and position.

CONTACT US

Our customers are important to us. We want to provide you the best customer service in the industry. If you have a comment or question, please send it to us. We strive to respond to all inquiries within 24 hours.

FIND A LOCAL AUTHORIZED DISTRIBUTOR IN YOUR AREA

Kennametal offers world-class products and services globally. Our distributors know us, and more importantly, they know you. They know better than anyone in the industry how to put the global power of Kennametal to work for you — in your industry, in your region, and for your business.

The KSSR™ 6° Inserts

Primary Application

The Kennametal new line of KSSR 6° inserts are versatile, easy to use, and right- or *left-hand neutral, making them ideal for automotive machining operations or any other industry that relies on transfer line manufacturing. Available in carbide and ceramic grades for applications in cast and ductile irons and alloy steels, KSSR 6° inserts can be used for all fine and coarse pitch styles.

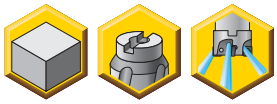
*Left-hand cutters are available as non-stock standard.

Features and Benefits

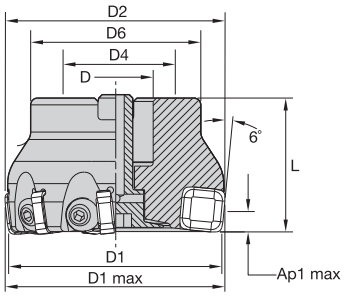
KSSR 6° Features

- Available in metric and inch products, diameters from 2.5–4"; for larger diameter custom solution is available.
- Fine and coarse pitch styles.
- Easy to use and to adjust with shorter setup time.
- Wiper inserts in carbide and ceramic provide excellent surface quality.

Improved Versatility



- Proven solution for the automotive segment.
- Right- and *left-hand cutters, ideal for transfer lines.
- Premium grades in carbide and ceramic for applications in cast and ductile irons and alloy steels.
- Inserts are neutral and can be used for right- or left-hand cutting.



Unrivaled Benefits

- Capability: .20" maximum depth of cut.
- Excellent accuracy:
  Radial = +/- .0001"
  Axial = adjustable +/- .0001"
- Inserts have eight true cutting edges.

- Eight cutting edges per insert.
- Fast and easy insert indexing.
- Highest feed rates.
- CGI specialist.

Kennametal Tools for **Railways** and **Wheel Machining**

Kennametal offers a complete line of tooling for wheel and axle maintenance in railroad shops. All tools incorporate the latest technology for maximum metal removal and higher productivity. They are proven performers in actual use over extended periods of time, under a wide range of operating conditions. Standard off-the-shelf inserts and fewer pieces of hardware reduce inventory and operating costs. Included in this range are tools for reconditioning mounted wheel sets, wheel boring, wheel truing, axle turning, and journal burnishing.

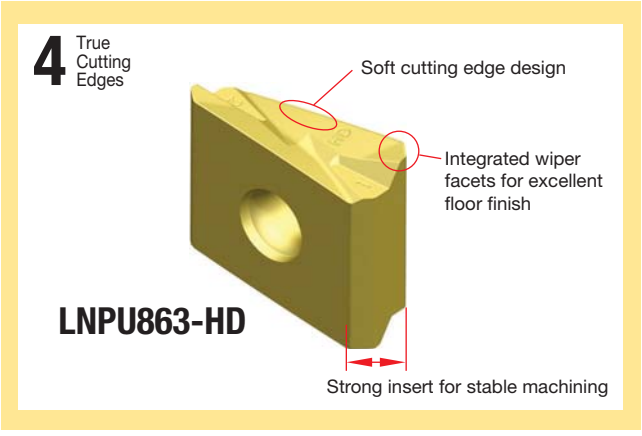
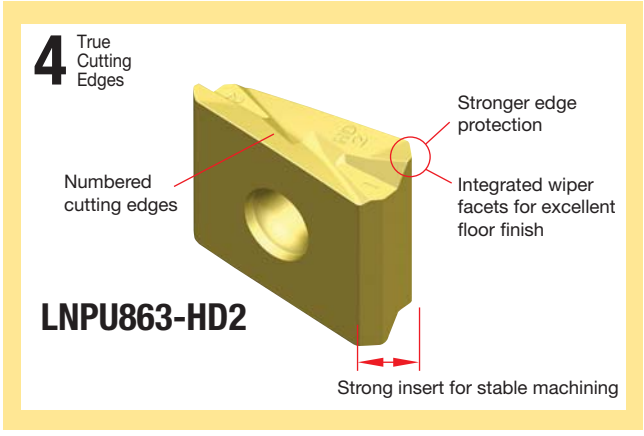
MEGA 45°

Superior Heavy-Duty Milling

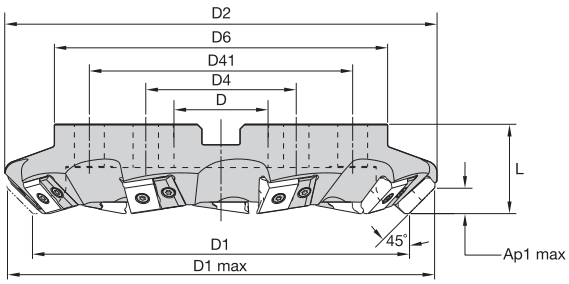


Primary Application



With four true cutting edges per heavy-duty MEGA 45° insert, you are getting the low cost per edge and high productivity you need and have come to expect from Kennametal. The soft cutting edge design enables 30% lower cutting forces, and the carbide shim provides protection to the cutter body. Choose MEGA 45° inserts for all steel and cast iron indexable milling needs.

Features and Benefits



Features	Benefits
• Four true cutting edges per heavy-duty MEGA 45° insert.	• Low cost per edge and high productivity.
• Soft cutting edge design.	• 30% lower cutting forces.
• Up to 30% increased Metal Removal Rates (MRR).	• Performance leader in steel and cast iron materials.
• Carbide pocket shims.	• Excellent cutter body protection.
• Cutting edge numbering system.	• Improved run out for better tool life and floor finish.
• HD2 geometry.	• Stronger edge protection to handle the toughest milling jobs, especially with scale and surfaces with varying thicknesses.

4 True Cutting Edges
Soft cutting edge design
Integrated wiper facets for excellent floor finish
LNPU863-HD
Strong insert for stable machining

4 True Cutting Edges
Stronger edge protection
Numbered cutting edges
Integrated wiper facets for excellent floor finish
LNPU863-HD2
Strong insert for stable machining

- Up to 30% higher Metal Removal Rate (MRR).
- Cutter body protection with carbide shims.

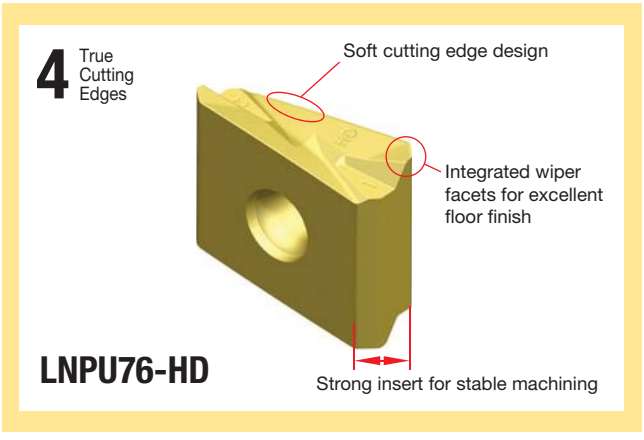
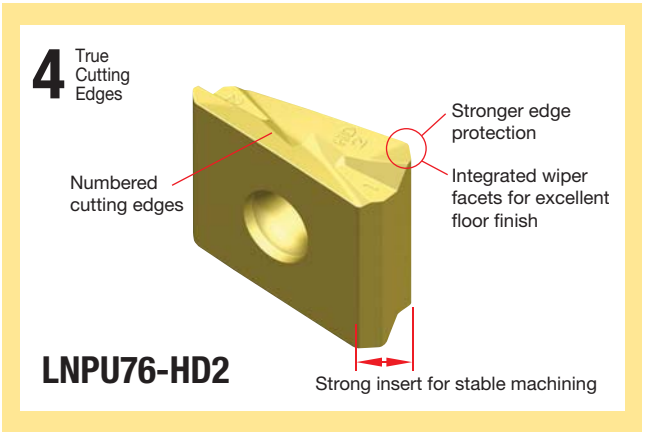
MEGA 60 and 90

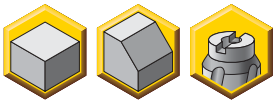


Primary Application

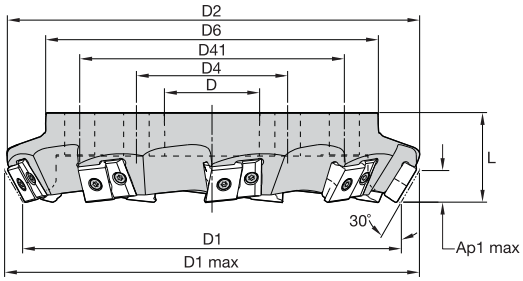


The real performance booster in heavy-duty milling. With four true cutting edges per heavy-duty insert, you are getting the low cost per edge and high productivity you need and have come to expect from Kennametal. The soft cutting edge design enables 30% lower cutting forces, and the carbide shim provides protection to the cutter body. Choose MEGA 60 and MEGA 90 for all steel and cast iron indexable milling needs.

Features and Benefits



Features	Benefits
• Four true cutting edges per heavy-duty MEGA 60 and 90 insert.	• Low cost per edge and high productivity.
• Soft cutting edge design.	• 30% lower cutting forces.
• Up to 30% increased Metal Removal Rates (MRR).	• Performance leader in steel and cast iron materials.
• Carbide pocket shims.	• Excellent cutter body protection.
• Cutting edge numbering system.	• Improved runout for better tool life and floor finish.
• HD2 geometry.	• Stronger edge protection to handle the toughest milling jobs, especially with scale and surfaces with varying thicknesses.



4 True Cutting Edges
Soft cutting edge design
Integrated wiper facets for excellent floor finish
LNPU76-HD
Strong insert for stable machining

4 True Cutting Edges
Stronger edge protection
Numbered cutting edges
Integrated wiper facets for excellent floor finish
LNPU76-HD2
Strong insert for stable machining

- Up to 30% higher metal removal rate (MRR).
- Cutter body protection with carbide shims.

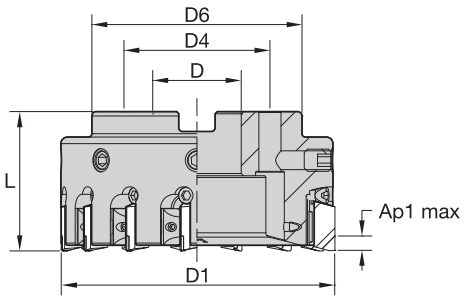
KBDM PCD Face Mills

Indexable Milling

Application

The new KBDM PCD milling platform is designed and engineered for aluminum face milling applications, targeting automotive requirements.

This proven design delivers consistent performance time and time again, and has done so for 20+ years. KBDM's new look, black anodized aluminum with yellow wedges, gives it a unique appearance. However, it's what is behind the cover that really matters. Performance is key, and KBDM does not disappoint.



Features and Benefits

- Cutter bodies manufactured from hard anodized aluminum provide lighter weight and excellent wear and erosion resistance.
- High-density platform geared toward faster machining cycles to help lower overall costs.
- All pockets are adjustable. Very-user friendly for axial adjustment less than 0.0002" (0,005mm), with a total adjustment of 0.032" (0,8mm).
- Two grades, KD1400™ and KD1425™, provide options in maximizing efficiencies based upon application.
- Roughing, semi-finishing, and fine-finishing with one platform.
- Two corner radii — 0.031 and 0.093" (0,8 and 2,4mm).
- Mini-tip insert for finishing applications.
- All standard inserts have a 0.06" (1,5mm) wiper facet for better surface qualities.
- Full face wiper available as a standard item.

Delivering Customer-Driven Performance for 20+ Years.

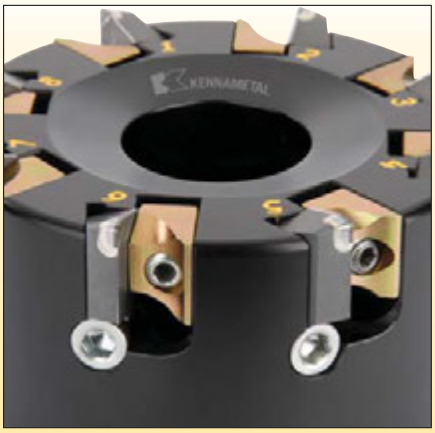
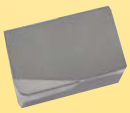
Face Milling

PCD Custom Solutions for Indexable Milling

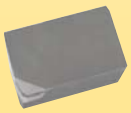


- Diameters up to 21.65" (550mm).
- Integral shank options, ie, HSK.
- Left-hand rotation.
- Internal coolant capable.
- PCD lengths up to 0.50" (12,7mm).
- Specific edge preps and nose radii available.

Insert Setting and Fine Adjustment Procedure



Face Mills



- Apply a small amount of lubricant to the following areas:
  - — Pocket area where the wedge slides.
  - — Threads of the insert locking screw.
  - — Threads of the axial adjustment screw.
- Install cartridges applying light torque to the wedge assembly locking screw.
- Turn axial adjustment screw until the cartridge is .0004–.0006" (0,01–0,015mm) below the final set height.
- Tighten the wedge assembly locking screw to 31 In/lbs and (4 Nm) to (3,5 Nm).
  - — 170.170 — Torque Screwdriver mm #**1138787**.
  - — 170.181 — 1/4" Drive Bit — 4mm Hex mm #**1138857**.
- Repeat for all inserts/pockets before final axial setting.
- Final Setting: Turn the axial adjustment screw moving the PCD insert 0.0002" (0,005um) to the final set height. Repeat for all pockets.

General

- Non-contact gages are preferred.
- Contact gages can be used with the following precautions:
  - — Indicator point must be flat and parallel to the base.
  - — Always approach the PCD insert from the relief angle under the PCD segment.
  - — Do NOT let the indicator drop on the PCD segment.
- Remove all worn PCD inserts.
- Clean the pockets of the cutter completely.

KBDM Wiper Setup

- Set Wiper 0.0006–0.0008" (15–20 microns) higher than standard PCD inserts. The KSDR102S Wiper is designed to be used only with 0.031 corner radius standard inserts in the other pockets.
- At this setting, the wiper radius will cover 0.28" (7,1mm) advancement before another wiper would be needed.
- Wiper radius is 30.0" (762mm).
- Ideal setup is to use only 1 wiper to achieve best surface quality. Use when Wt is a requirement.

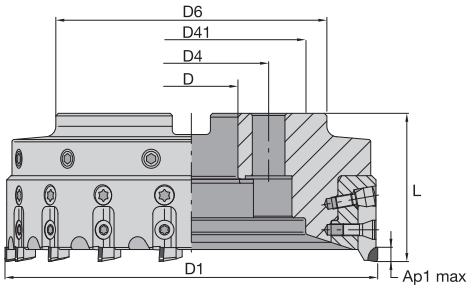
Example: KBDM200SD24 Face Mill
Feed per tooth: 0.008" (0,2mm)
# of inserts: 24
Advancement per revolution:
Metric: 0,2 x 24 = 4,8mm
Inch: 0.008 x 24 = 0.192"
4,8mm < 7,1mm wiper length

NOTE: Large diameter cutters 10.0" (250mm) and up would be candidates for more than 1 wiper. Due to more inserts in the cutter, the advancement per revolution might exceed the coverage of 1 wiper.

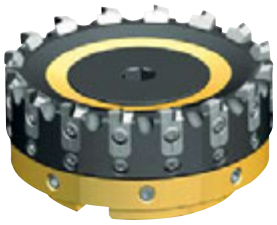
The KSCM™ AluMill™ System

Primary Application

The KSCM AluMill face milling program is specifically engineered to deliver best-in-class performance in high-volume aluminum machining operations. Runs at higher speeds with no chatter while still easy to adjust. KD1420™ grade materials provide long tool life, and with the Kennametal Blue Box™ program for reconditioning worn cartridges, you can reduce inventory costs as well!



Features and Benefits



- Anti-vibration cutter design.
- Best rigidity for high feed rates.
- Unique dovetail wedge clamping design.
- No radial movement of cartridges.
- Centrifugal force protection cartridge design.
- Integrated chip gash into cartridge.
- Quick setup and easy adjust concept.
- Flexible cartridge configuration.
- No bur cartridges for fine finishing.
- Blue Box™ service.

- PCD cartridge face mill for high production aluminum face milling.
- Rough and finish in one operation.
- Precision balanceable cutter bodies produce mirror-finish surfaces.

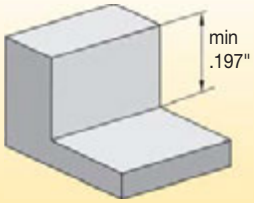
Tool Configuration • Universal Cartridge

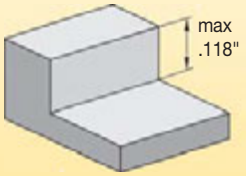


Face milling cutter fitted entirely with universal cartridges.

Depth of Cut:
max .118"

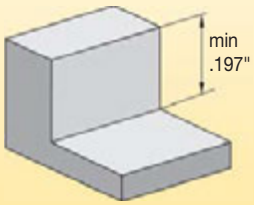
Surface Quality:
Rz2 - Rz4

Contouring:
PCD cutting edge length = .197"



Tool Configuration • Universal Cartridge

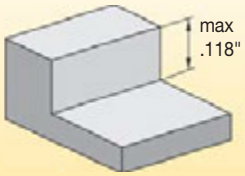
+ Finishing Cartridge



Fitting the face milling cutter with universal and finishing cartridges in a ratio of approximately 3:1.

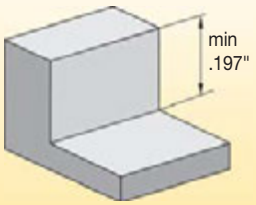
Depth of Cut:
max .118"

Surface Quality:
Rz1,5 - Rz2,5



Contouring:
PCD cutting edge length = .197"

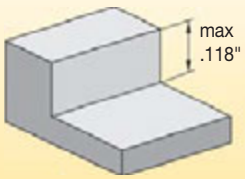
Tool Configuration • Edge Cartridge



Fitting the face milling cutter entirely with edge cartridges.

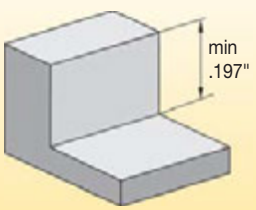
Depth of Cut:
max .118"

Surface Quality:
Rz2 - Rz4



Contouring:
PCD cutting edge length = .197"

Tool Configuration • Cartridge for Defined Surfaces



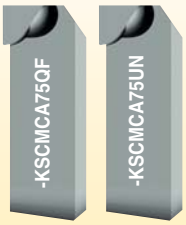
Fitting the face milling cutter entirely with cartridges for defined surfaces.

Depth of Cut:
max .118"

Surface Quality:
Rz3,2 - Rz17

Contouring:
PCD cutting edge length = .197"

Tool Configuration • Universal Cartridge, 75° Face Milling



1. Insert cartridges into the body.
2. Screw in the clamping screws (RH), and tighten to 88 in. lbs.
3. Screw in the adjusting screws (RH), and tighten to 26 in. lbs.

4. Determine which cartridge is in the highest axial position.
5. By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.

Tool Configuration • Universal Cartridge + Finishing Cartridge (Ratio Approx. 3:1), 75°

1. Insert universal cartridges at ratio of approximately 4:1 in the body. Make sure they are evenly distributed!
2. Screw in the clamping screws (RH), and tighten to 88 in. lbs.
3. Screw in the adjusting screws (RH), and tighten to 26 in. lbs.

4. Determine which cartridge is in the highest axial position.
5. By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.

6. Insert finishing cartridges as described in Steps 1–5 but with an axial advance of .0003" + .0008". Max permitted runout error of 3 µm with finishing cartridges.

Tool Configuration • Edge Cartridges, 90° Shoulder Milling

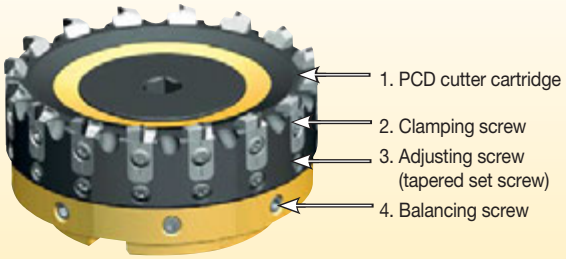
1. Insert cartridges into the body.
2. Screw in the clamping screws (RH), and tighten to 88 in. lbs.
3. Screw in the adjusting screws (RH), and tighten to 26 in. lbs

4. Determine which cartridge is in the highest axial position.
5. By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.

Tool Configuration • Cartridge for Defined Surface, 75°

1. Insert cartridges into the body.
2. Screw in the clamping screws (RH), and tighten to 7 ft. lbs.
3. Screw in the adjusting screws (RH), and tighten to 26 in. lbs.

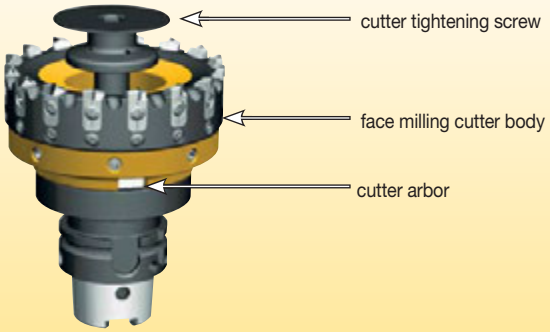
4. Determine which cartridge is in the highest axial position.
5. By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.



NOTE: The process must be repeated when the cartridges are changed. To dismantle, remove the adjusting element (Part 3), clamping screw (Part 2), and cartridge (Part 1).

Instruction for Mounting the Face Milling Cutter on the Appropriate Toolholder

User Information:

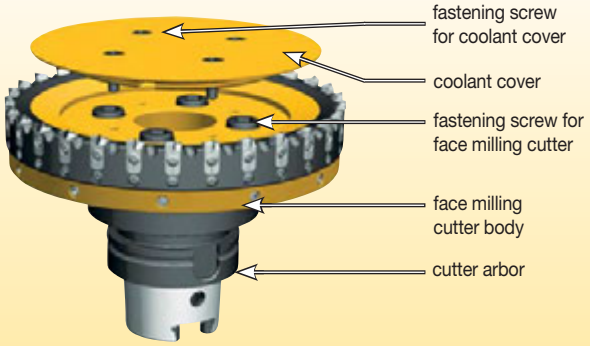


- Tools conform to EN ISO 15641.
- Absolute cleanliness must be observed when assembling the face milling cutter.
- An optimum cutting result will only be achieved by adjusting and balancing the complete tool system (face milling cutter + toolholder).
- Balancing is achieved with the aid of the balancing screws. Quality class G2.5 DIN-ISO 1940.
- The balancing screw must not protrude above the body.
- The balancing and adjustment screws have an adhesive coating according to DIN 267, Part 28. If, after repeated use, the coating is no longer adequate to secure the screws, the screws must be replaced.
- The maximum permitted operating speed (quoted on the tool) must not be exceeded.
- The maximum permitted operating speed is only permitted with clamping systems manufactured by Kennametal in accordance with DIN 69982 Form B with enlarged plane bearing surface. Reduce the operating speed if clamping systems with increased projection length or made by other manufacturers are used.
- Tools and fittings are to be serviced and repaired by Kennametal.
- Screws sealed with lacquer have been adjusted by the manufacturer, and must not be moved.

Instructions for Fitting the Cutter Cartridge • Tool Construction

When mounting the face milling cutter (dimensions similar to DIN 8030 Form B), place the body of the face milling cutter on the arbor. Ensure that the contact faces are clean. Screw in the cutter fastening bolt (RH) and tighten with the appropriate torque.

Tightening torque for the central cutter tightening screw:
M20 (adapter diameter 40): **184 ft. lbs.**
M16 (adapter diameter 32): **110 ft. lbs.**
M12 (adapter diameter 27): **59 ft. lbs.**



Mounting the Face Milling Cutter (Dimensions Similar to DIN 8030 Form C)

Place the body of the face milling cutter on the arbor. Ensure that the contact faces are clean. Screw in the fastening bolt (RH) and tighten with the appropriate torque. Put the aluminum coolant cover in place and fasten with the Torx fastening screws.

Tightening torque for the face milling cutter fastening screws:
M20: 184 ft. lbs.
M16: 81 ft. lbs.
M12: 36 ft. lbs.

Tightening torque for the coolant cover fastening screws:
M8: 13 ft. lbs.

KSCM AluMill
Reconditioning Service

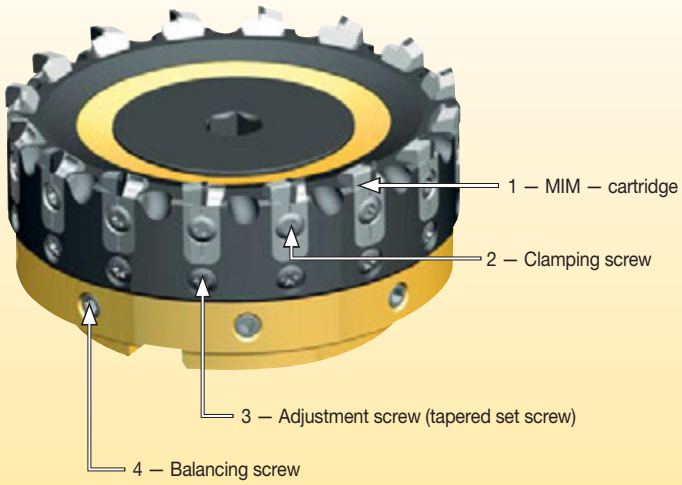
Kennametal

New Supply

On request, the face mill will be delivered with cartridges already mounted and adjusted.

Service Level • PCD Insert Reconditioning

Reconditioning of PCD cartridges up to three times.



• Tool diameter and length remain constant.

Face mill will be delivered with exchanged cartridges already mounted, adjusted, and balanced.

Tool Design

Information:

- KSCM tools conform to EN ISO 15641.
- Absolute cleanliness is needed when assembling the cutter.
- For optimum results, adjust and balance the complete tool system (face milling cutter + toolholder).
- Balancing is achieved with the aid of balancing screws. Quality class G2.5 DIN-ISO 1940.
- The balancing screw must not protrude above the body. The balancing and adjustment screws have an adhesive coating according to DIN 267, Part 28. After repeated use, the coating may no longer be adequate to secure the screws; the screws must be replaced.
- Do not exceed the maximum operating speed.
- Maximum operating speed is only permitted with clamping systems manufactured by Kennametal in accordance with DIN 69982 Form B with enlarged plane bearing surface. Reduce the operating speed if clamping systems with increased projection length or made by other manufacturers are used.
- Tools and fittings are to be serviced and repaired by Kennametal.
- Screws sealed with lacquer have been adjusted by the manufacturer, and must not be moved.
- A centrifugal force test was done.
- If the tools will be used for HSC, referred to in DIN EN ISO 15641, machines have to fulfill the special safety requirements.

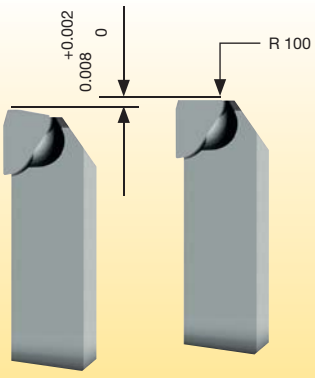
Assembling

1 Lubricate small cove on the MIM cartridge with copper paste of Liqui Moly.

2 Insert universal cartridges at approximate ratio 3:1 into the body. Make sure that they are distributed evenly!

3 Screw in the clamping screws (RH) and tighten to 8 Nm.

4 Screw in the adjusting screws (RH) and tighten to 3 Nm.



5 Determine which cartridge is in the highest axial position.

6 By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.

7 Insert finishing cartridges as described in steps 1–6 with an axial advance of 0,008 +0,002mm. Max permitted runout error of 3 µm with finishing cartridges.

NOTE:
- The process must be repeated when the cartridges are changed. To dismantle, remove the adjusting element (Part 3), clamping screw (Part 2), and cartridge (Part 1).
- For special requirements, e.g. surface quality, the configuration and the adjustment of the tool and inserts have to be done in relation with these requirements.
- If spare parts have to be ordered, reference the drawing.

Leader in Advanced Face Milling Applications

Dodeka™ Mini

The Dodeka Mini series is the most comprehensive face milling booster on the market today and offers fast, accurate indexing — with only one screw!

It is the first choice for long-reach face milling applications, or light fixtures with up to 40% shorter machining cycle time. With a standard offering of 15°, 45°, and 60° in combination with Beyond™ premium milling grades, expect up to 35% better tool life in light to heavy machining.

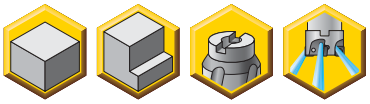
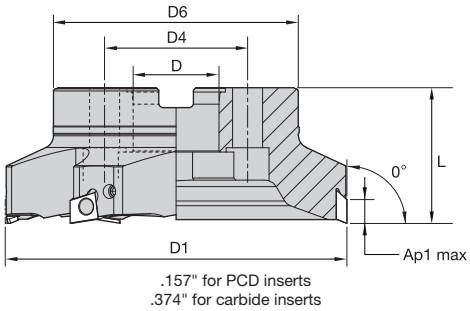
Fix-Perfect™ 0° Aluminum

Primary Application



The Fix-Perfect 0° milling cutter is excellent for machining aluminum and non-ferrous materials. The 24° positive rake provides free cutting action while producing superior finishes and flatness.



Features and Benefits

- Achieve true 0º shoulder.
- Roughing and finishing in one tool.
- Full safety first insert clamping.
- Easy adjustable pocket seats for fine finishing (PM, HPM, HSM Line).
- Achievable floor surface quality: Ra = 0.5.
- Very soft cutting action.
- Axial depth of cut Ap1 max = 3.74".

- Excellent for milling aluminum and non-ferrous materials.
- Good choice for thin-wall or poorly fixtured workpieces.
- 24° positive rake enables free cutting action.
- Produces excellent finish and flatness.
- Maximum speed is 6,500 SFM.

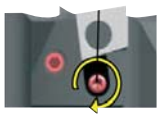
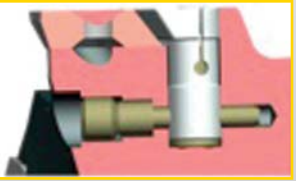
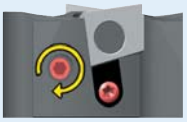
Introduction to Fitting Cutting Bodies

Roughing indexable inserts
BGHX15L5PC..GG.







Finishing indexable inserts
BGHX15L5PC..GG.1W

Clean dust, grease, etc., from the insert seat, insert (1), and clamp stud (2).

	PM	HPM/HSM	PM/HPM/HSM
1	Loosen the adjusting element (4).  Loosen the adjusting screw (5).	Loosen the adjusting element (4).  Loosen the adjusting screw (5).	Loosen the adjusting element (4).  Loosen the adjusting screw (5).
2	Insert the indexable inserts and tighten with the clamping screw (3) 44 in. lbs.  ATTENTION: Ensure that the insert is correctly positioned in the insert seat.	Insert the indexable inserts and pre-tighten with the clamping screw (3) 13 in. lbs.  ATTENTION: Ensure that the insert is correctly positioned in the insert seat. Determine which cutting body is the highest on the axis.	Insert the indexable inserts and pre-tighten with the clamping screw (3) 9 in. lbs.  ATTENTION: Ensure that the insert is correctly positioned in the insert seat. Determine which cutting body is the highest on the axis.
3	Tension the adjusting element (4) by tightening the adjusting screw (5) to the specified torque of 4.5 in. -lbs. 	Extract by .0008" the insert that is axially the highest by turning the adjusting screw (5).  Adjust the remaining inserts to the desired runout with maximum travel of the inserts .008".	Adjust the finishing indexable insert(s) to the desired projection, preferably .0015" by turning the adjusting screw (5).  ATTENTION: Ensure that the insert is correctly positioned in the insert seat.
4	 **Adjustment element to be replaced by Kennametal Service Center only.**	Clamp the insert by tightening the clamping screw (3) to the specified torque of 44 in. lbs. 	Clamp the insert by tightening the clamping screw (3) to the specified torque of 44 in. lbs. 

Mobile App

The Kennametal mobile app makes it easy to access product information, calculators, and much more from iPhone® and Android™ devices.

FEATURES

Scan a Kennametal tool package barcode or search a product catalog number to access complete product information.

Product information includes tool image, dimensions, grades, and product highlights.

View product availability at global locations.

Get speed and feed information in inch and metric values for all metalcutting products.

View tech tips for helpful solutions to common machining questions.

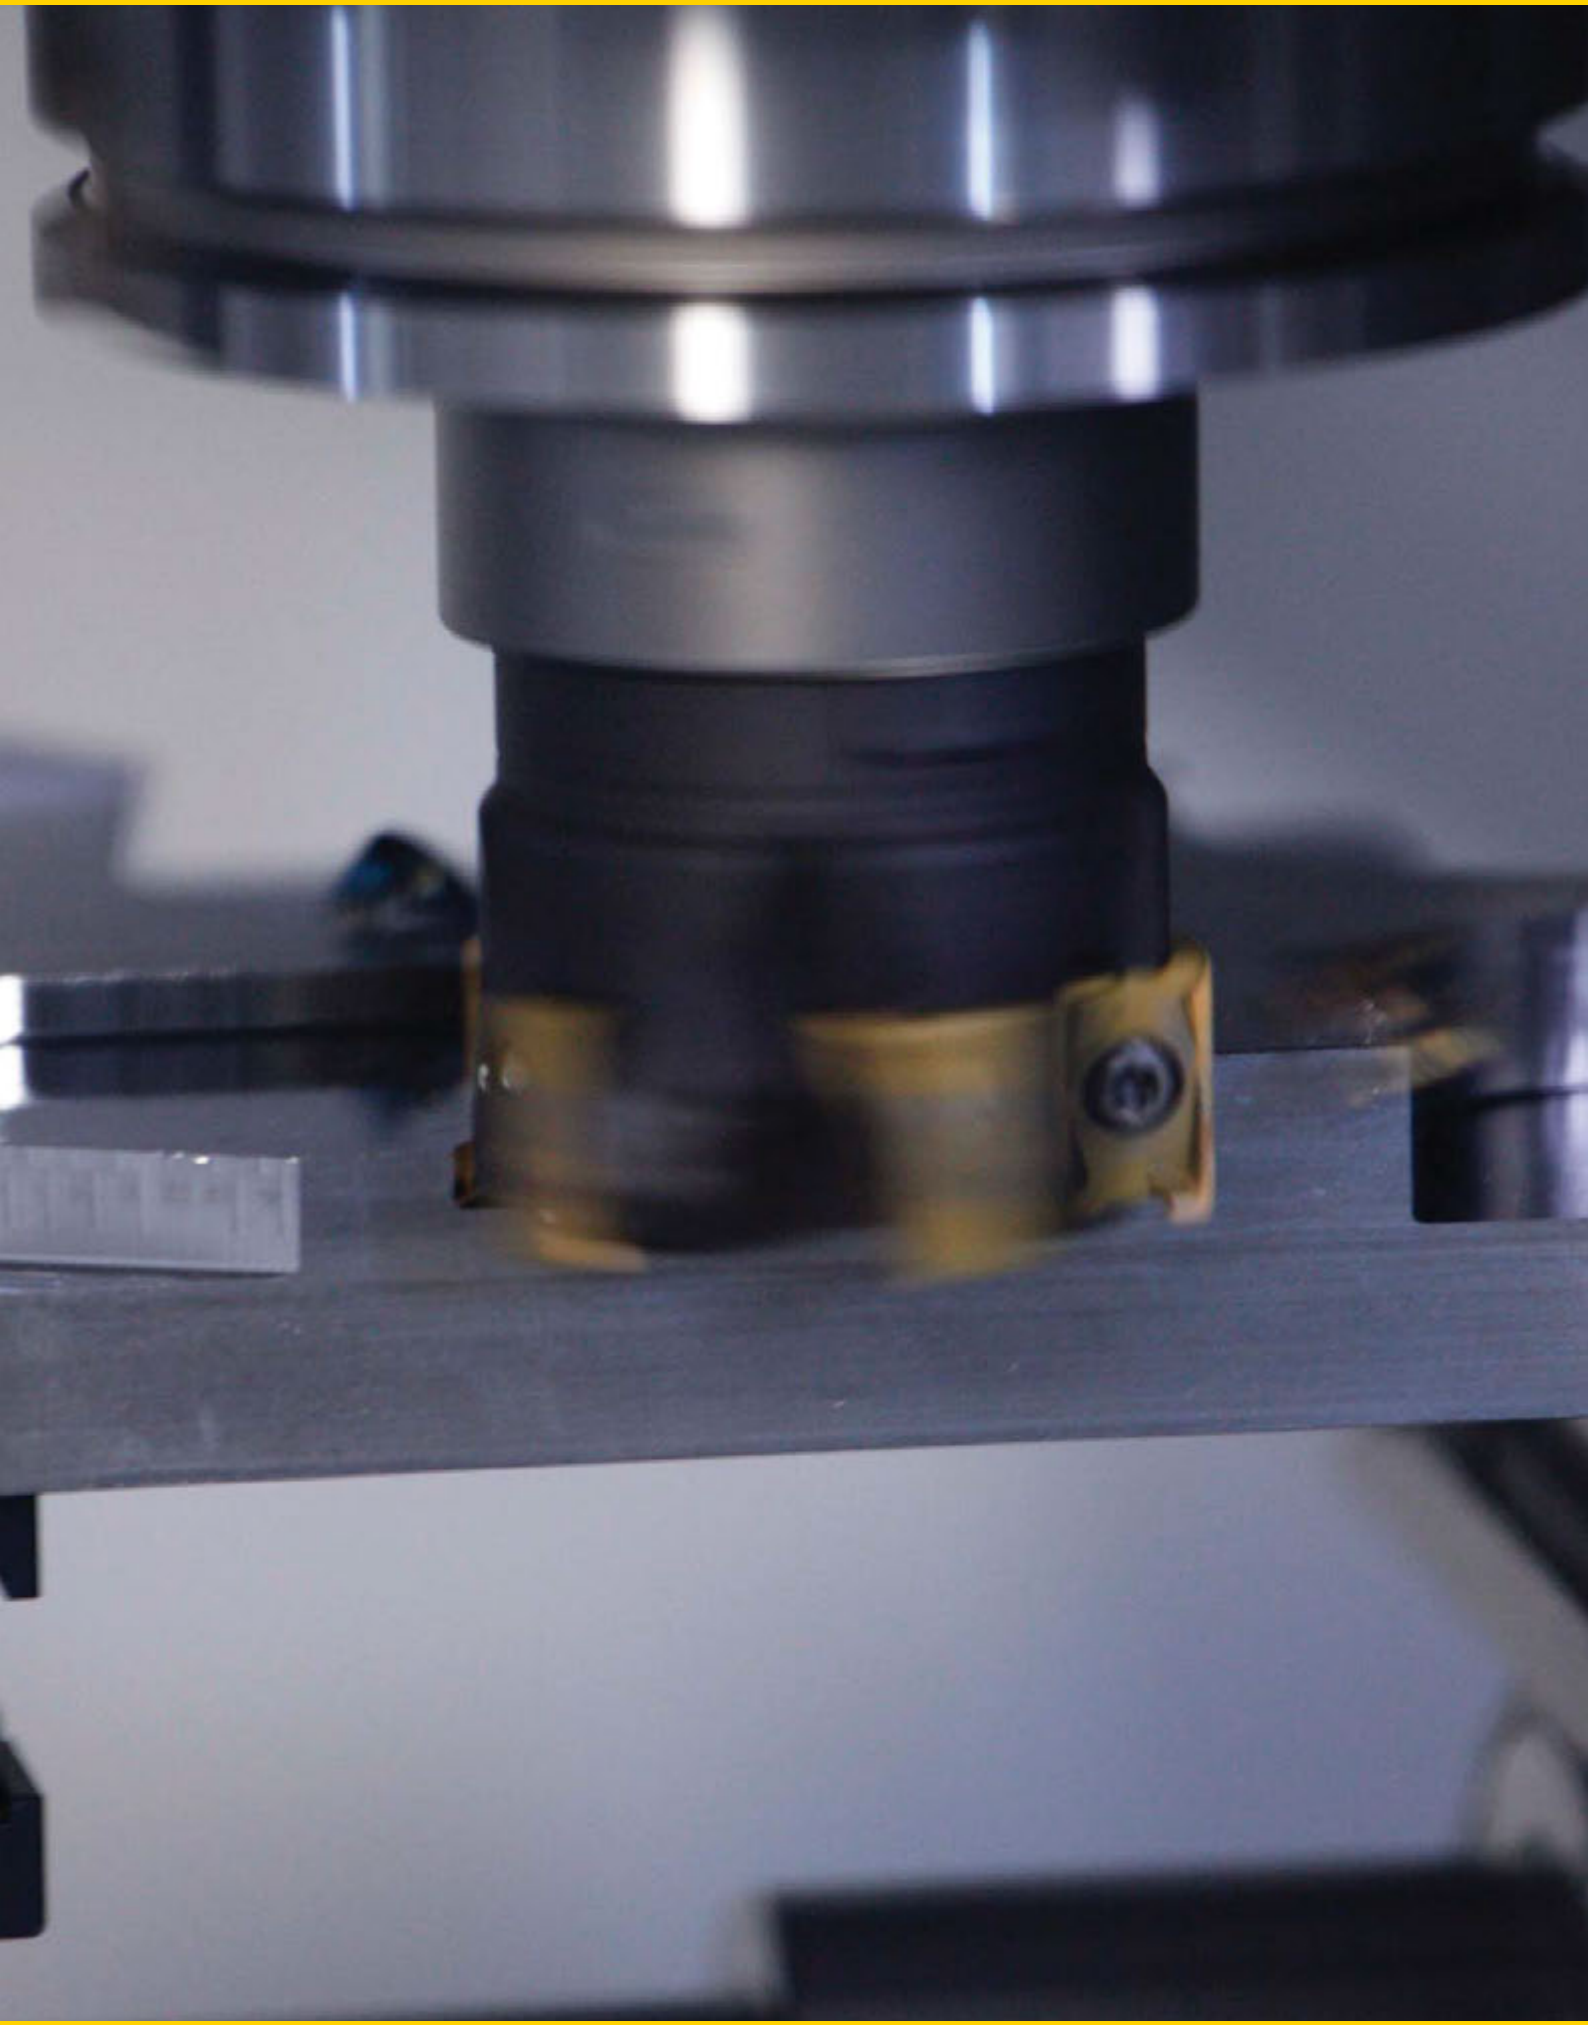
Contact Customer Support directly from the app.

MACHINING CALCULATORS

View data for milling and drilling applications.

Inch and metric values calculated.

ORDERING



Login using your Konnect credentials to complete a purchase.

WHERE TO FIND IT

Download the free app today from iTunes® or the Google Play™ store.

ANDROID APP ON Google play

Available on the App Store

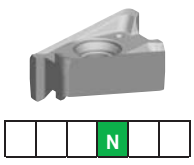
Mill 4-11™

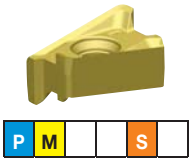
One tool for all applications.



The Mill 4™ series is specially engineered to achieve excellent surface quality and higher metal removal rates in shoulder milling applications. Its unique design allows you to apply the tool in multiple passes (stepping down) with outstanding results.

From roughing to finishing operations, the Mill 4 series is applicable in a wide range of workpiece materials: steel, cast iron, stainless steel, non-ferrous materials, and high-temp alloys.

Features and Benefits

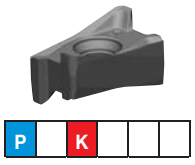


- Double-sided strong insert with 4 cutting edges.
- High positive geometry for lower cutting forces.
- Superior wall and surface finish capabilities.
- “Stepless” solution for multiple-pass operations.
- Comprehensive offering to cover all applications in all material groups.

-ELEJ

For non-ferrous materials.

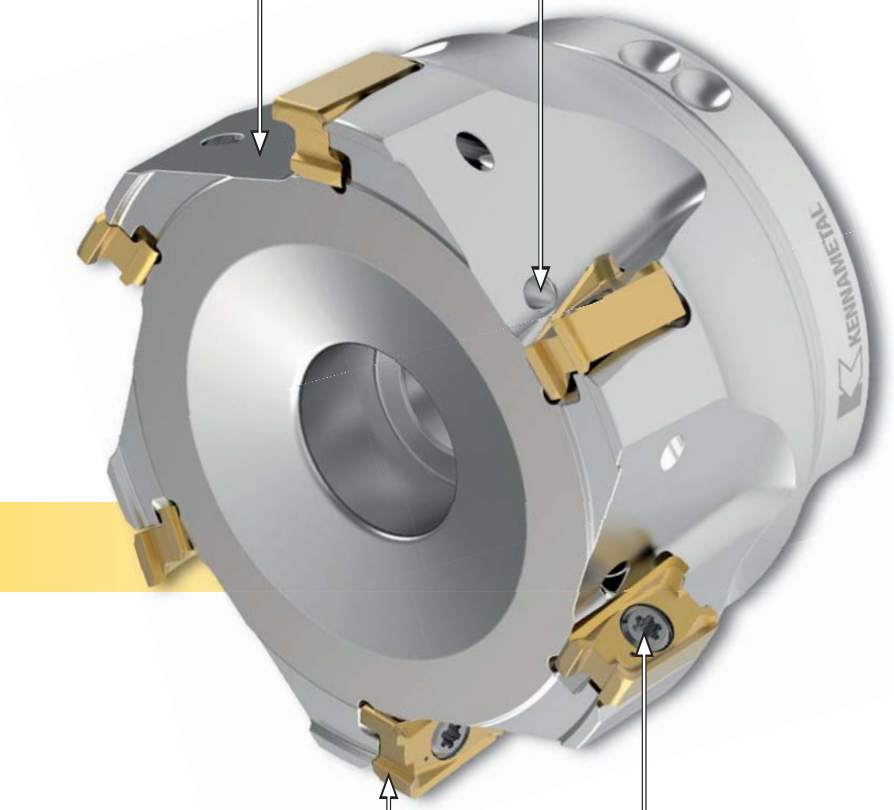
-EGE



1st choice for stainless steel. Lower cutting forces.

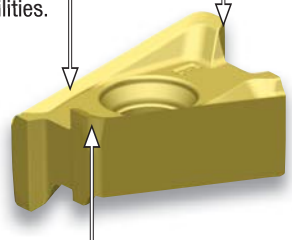
-SGE

First choice for Mill 4 platform, especially when machining steels.



-SGEM

1st choice for cast iron. Strongest cutting edge.

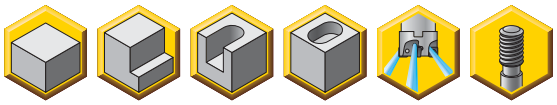


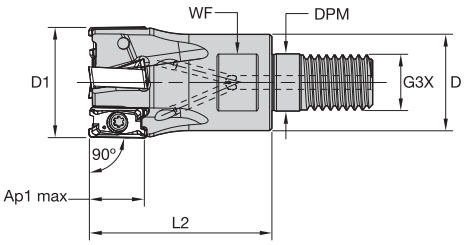
Uneven pocket spacing.

Screw-on, end mills, and shell mill cutter with internal coolant.

Integrated wiper facet for best-in-class floor finisher.

Up to 0.433" (11mm) Ap capabilities.





Multiple corner nose radii available from .016" (0,4mm) up to .063" (1,6mm).

TP9 insert screw (M3) to provide higher reliability and safe processes.

Double-sided insert with 4 cutting edges.

- One tool for all applications: from roughing to finishing.
- Superior wall and surface finish capabilities. Best choice for stepping down operations.
- Up to 0.433" (11mm) depth of cut.
- Screw-on cutters provided better rigidity and stability when used with small spindles: BT30, BT40, DV40, HSK50, HSK63, etc.
- Screw-on cutters can be less expensive when compared to cylindrical shank cutters due to their higher flexibility through multiple holder combinations.

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Mill 4-11 Starter Kits

Order one of our starting kits and test the performance of our new Mill 4 platform. The kits are set up to serve the majority of shoulder milling applications, delivered with a cutter body as well as 20 inserts from a premium Kennametal grade.

Detailed order information can be found in the table below.

Order one Mill 4 Kit and experience the next level of shoulder milling!

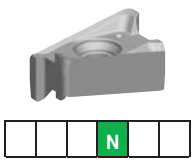
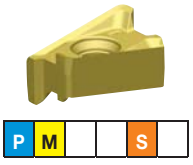
Mill 4-15™ • Double-Sided Shoulder Milling



Primary Application

The Mill 4-15 series is specially engineered to achieve excellent surface quality and higher material removal rates in shoulder milling applications. Its unique design enables multiple passes (stepping down) with outstanding results. The Mill 4™ platform is applicable in a wide range of workpiece materials: steel, cast iron, stainless steel, and titanium, from roughing to finishing operations.

Features and Benefits

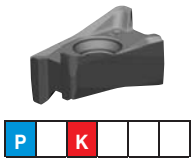


- Double-sided strong insert with 4 cutting edges.
- High positive geometry for lower cutting forces.
- Superior wall and surface finish capabilities.
- "Stepless" solution. No mismatch when machining walls in different steps.

-EGEJ

For non-ferrous materials.

-EGE

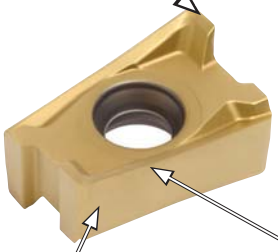


1st choice for stainless steel. Lower cutting forces.

-SGE

First choice for Mill 4 platform, especially when machining steels.

-SGEM

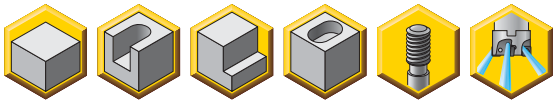


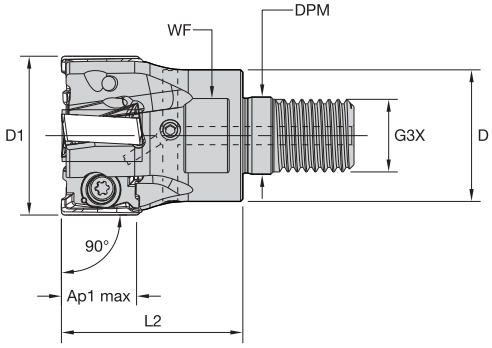
1st choice for cast iron. Strongest cutting edge.

Screw-on, end mill, and shell mill cutters with effective internal coolant supply.

State-of-the-art stepping down capabilities — "stepless" solution.

Multiple corner nose radii available.



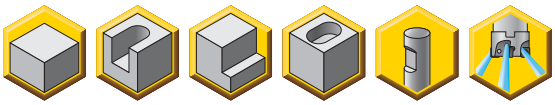


Up to .610" (15,5mm) depth-of-cut capabilities.

Innovative cutting geometry to provide superior wall and surface finish capabilities.

Integrated wiper facet for best-in-class floor finishing.

- Superior wall and surface finish capabilities.
- True 90° capabilities. Stepless solution when using multiple steps.
- Engineered to run up to .610" (15,5mm) depth of cut.
- Effective internal coolant feature, reaching the cutting edge precisely.



Screw-On End Mills

Mill 4-15 Starter Kits

Order one of our starting kits and test the performance of our new Mill 4 platform. The kits are set up to serve the majority of shoulder milling applications and workpiece materials, delivered with a cutter body as well as 20 inserts from a premium Kennametal grade.

Order one Mill 4 kit, and experience the next level of shoulder milling!

Detailed order information can be found in the table below:

Mill 1-7™

Primary Application

Mill 1-7 is engineered for small-component machining and covers multiple applications, including ramping, slotting, and plunging. Mill 1-7 tools provide solutions for roughing and finishing operations in energy, aerospace, and general engineering, where small-diameter end mills are required.

Features and Benefits

- Mill 1-7 inserts enable the use of higher density cutters, providing greater feed and higher metal removal rates.
- Super positive rake provides soft action and low cutting forces for smooth entry and exit from the component. Run at higher feed rates while using less power.
- Inserts are designed with elliptical cutting edges and are optimized for a straight 90° wall.
- Inserts are available in five grades: KC725M™, KCSM30™, KCPM40™, KCPK30™, and KC522M™.
- Ramping, slotting, and plunging capabilities in one platform.

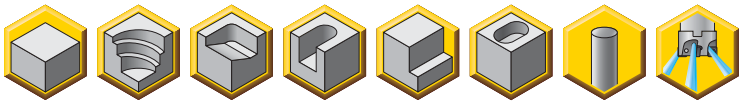
High-Performance Shoulder Mill

20º rake face angle and 13º clearance angle for soft cutting action and reduced cutting forces.

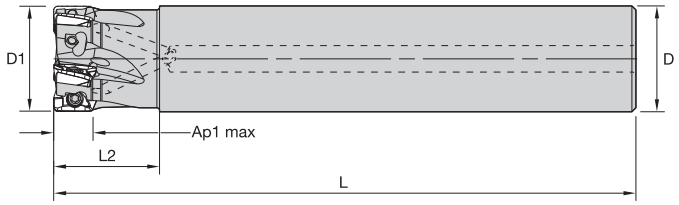
Internal coolant/air supply.

All pockets are machined into heat-treated material, which guarantees runout and pocket strength.

Elliptical edge generates 90º wall.



Chip gash designed for excellent chip evacuation.



Margin along the main cutting edge and wiper facet for extra strength.

Insert screw: Torx 6.

Increase ramping capability up to 5.5º.

- Mill 90° walls.
- Aggressive ramping rates.
- High speed machining.
- Ramp, slot, plunge, face, and shoulder milling.

NOTE: Max ramp angle decreases as nose radius increases.

Titanium and Stainless Steel Machining with New Milling Grade KCSM40™

Achieving maximum metal removal rates with highly engineering solutions from Kennametal.

- Ideal for roughing and semi-finishing operations.
- Available for the following milling series:
  - Mill 1™
  - Mill 4™
  - Dodeka™
  - MEGA™
  - KSOM™
  - NGE™
  - KSSM™
  - KSSM8+™
  - Rodeka™
  - 5230 Series
  - 7713 Series
  - 7792 Series
- This new carbide substrate provides toughness and fatigue resistance, minimizing the tendency for thermal cracking.
- The new coating provides high hot hardness and high abrasive resistance for unmatched tool life.
- KCSM40 milling grade is the first choice for high metal removal jobs in titanium structural aerospace components.
- Proven solution for various stainless steel applications, like machining automotive turbo chargers.

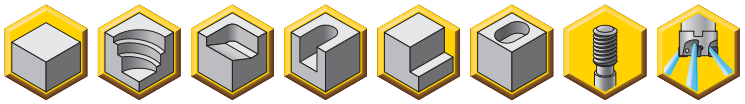
Mill 1-10™

High-Performance Shoulder Milling Platform

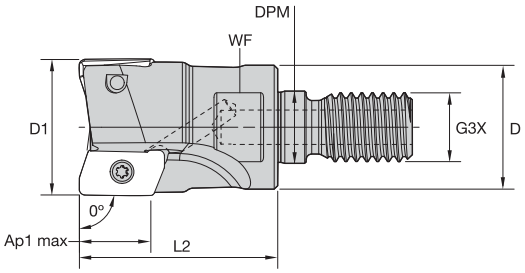
Primary Application

The multifunctional Mill 1-10 platform works with all tool materials in shoulder, ramp, slot, plunge, and helical milling with one insert style to improve productivity and reduce inventory and machining costs. The super positive cutting rake, soft cutting action, and low cutting forces enable higher feed rates and spindle protection. Innovative insert and cutter body designs offer improved ramping capabilities.

Features and Benefits



Versatility



- Works with all tool materials.
- Capable of shoulder, ramp, plunge, and helical milling.
- Internal coolant and air supply.

Advantages

- Optimized soft cutting edge.
- Elliptical edge generates 0° wall.
- Increased ramping capability due to state of the art insert and cutter body design.
- Innovative chip gash design for excellent chip evacuation and perfect cutter body stability.
- All pockets are machined into heat-treated materials, guaranteeing best-in-class runout and pocket strength.
- Inserts feature innovative margin along the main cutting edge, corner nose radius, and wiper facet for perfect edge stability.

- Mill 0° walls.
- Ramping capable for all Mill 1-10.
- Generates superior surface finish.
- High RPM capabilities.

1.000	**MS2205**	9.0	**DT7IP**
1.250	**MS2205**	9.0	**DT7IP**

NOTE: Standard milling cutters will accept insert nose radii up to .079" without modification.

- Mill 0° walls.
- Aggressive ramping rates.
- Generates superior surface finish.
- High RPM capabilities.

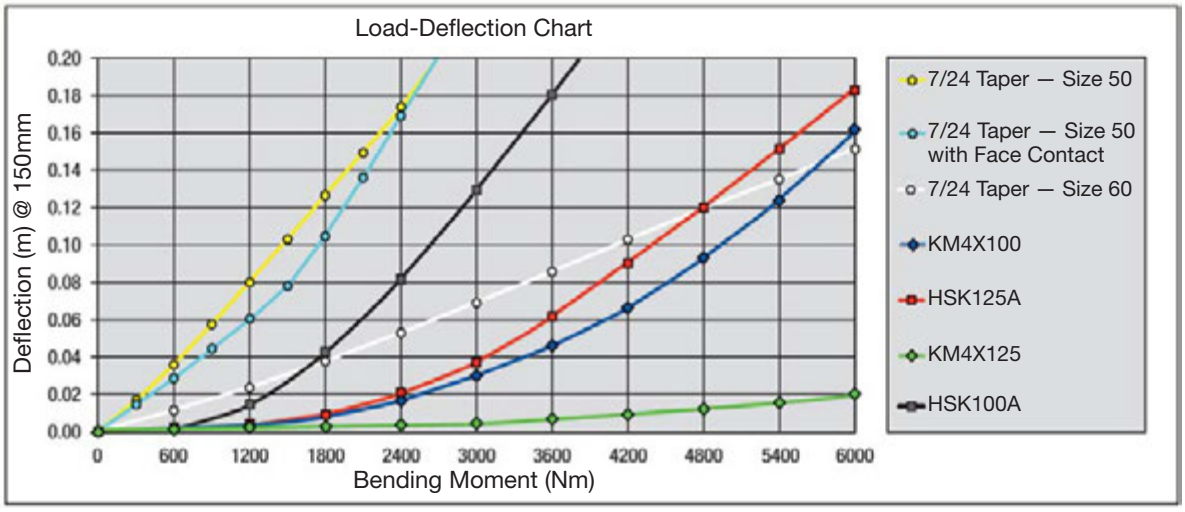
NOTE: Max ramp angle decreases as nose radius increases.

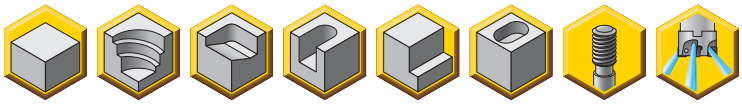


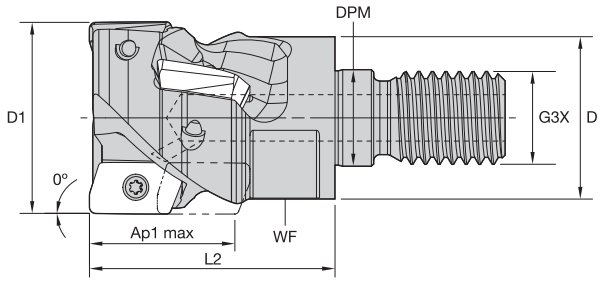
KM4X™

The Latest Innovation in Spindle Interface Technology!

Dramatically increase your metal removal rates when machining high-temperature alloys!

- Run jobs at significantly faster feeds and speeds than what is achievable with other spindle interfaces.
- Unique use of clamping force and interference level increases clamping capability 2 to 3 times.
- Achieve lower cost of ownership, increased throughput, and superior results.





Visit **kennametal.com** or contact your local Authorized Kennametal Distributor.

KENNAMETAL®

kennametal.com

- Mill 0° walls.
- Aggressive ramping rates.
- Generates superior surface finish.

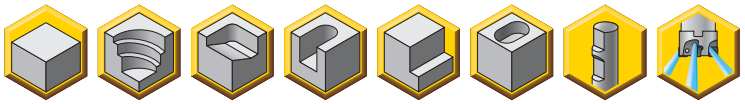
Please see pages X22–X37 for recommended starting speeds.

Mill 1-14™

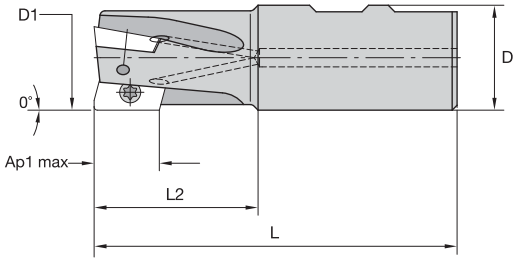
Primary Application

The Mill 1-14 series is a versatile, functional cutter system for a range of cutting tasks. Mill 1-14 cutters can be used for profiling, slotting, ramping, helical interpolation, circular interpolation, and other milling applications. It's a single tool with multi-functional benefits. Mill 1-14 inserts are specially designed to add cutting versatility. Innovative micro-geometry features contribute greatly to enhanced performance, various rake angles, negative T-land, and small hone. Results include significantly reduced cycle times and lower cutting forces. Test results in producing 0° walls have proven excellent with the GD2 geometry.

Features and Benefits



Features



- Insert geometries and grades for most workpiece materials.
- Insert radii from .016" (0,15mm) up to .157" (4mm).
- Axial depth of cut up to .551" (14mm).
- Beyond™ grade technology.

Benefits

- Easy cutting action, even on entry and exiting the workpiece.
- Polished geometry for aluminum machining.
- Slotting, profiling, ramping, helical interpolation, and plunging.

- Mill 0° walls.
- Aggressive ramping angles.
- Generates superior surface finish.
- High RPM capabilities.

FIND THE LATEST PRODUCT INFORMATION

Whether your operation is turning, milling, or holemaking, Kennametal brands are the high-performance tooling you need. We offer standard and custom solutions for a wide range of applications.

Find information about our most current campaigns and catalogs.

Register on Konnect for the full functionality of the Kennametal online ordering website.

CONTACT US

Our customers are important to us. We want to provide you the best customer service in the industry. If you have a comment or question, please send it to us. We strive to respond to all inquiries within 24 hours.

FIND A LOCAL AUTHORIZED DISTRIBUTOR IN YOUR AREA

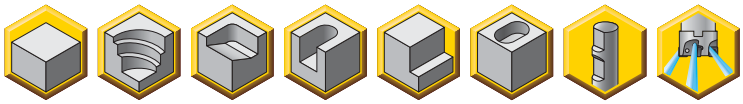
Kennametal offers world-class products and services globally. Our distributors know us, and more importantly, they know you. They know better than anyone in the industry how to put the global power of Kennametal to work for you — in your industry, in your region, and for your business.

Mill 1-14™
Helical Cutters

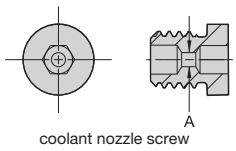
Primary Application

Mill 1-14 helical cutters will increase axial depth of cut. Designed with axial support pins for added stability, the Mill 1-14 helical cutters feature essential Load-Optimized Insert Spacing™ (LOIS) technology. LOIS dramatically minimizes unwanted vibrations and fluctuations in power requirements, resulting in a much smoother-sounding cut. Up to nine different coolant nozzle diameters enable tailoring to suit each machine tool, providing remarkably consistent, focused coolant flow.

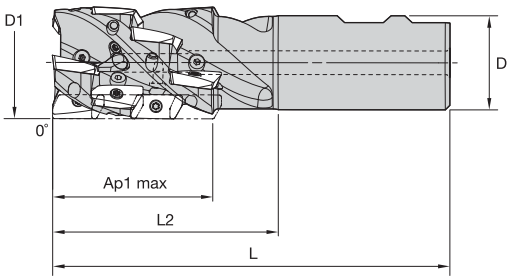
Features and Benefits



Functions



- Improves axial depth of cut better than standard end mills due to the positioning of inserts in helical configuration.
- Up to nine different coolant nozzle diameters tailored to suit each machine tool.
- One tool that offers features common to end mills, but rarely seen on a helical cutter:
  Helical ramping from solid, slotting, contouring, ramping, and plunging.



Benefits

- Increases depth of cut.
- Consistent, focused coolant flow.
- Built for performance, accuracy, and versatility.

- Aggressive ramping rates.
- Generates superior surface finish.
- Mill 0° walls.
- Axial support pins.
- Unique coolant nozzles.

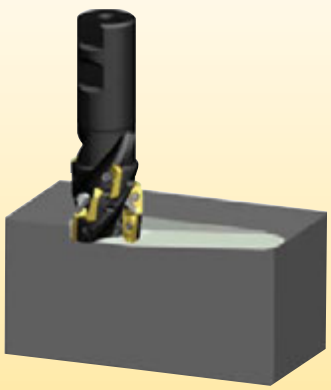
Mill 1-14	2.50	1.9°	4.367	4.822	5

Best Machining Practices

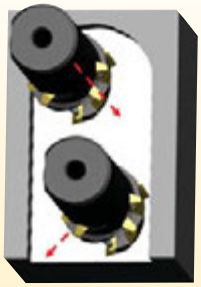


Contouring/Profiling

Ae = up to 50% of cutter Ø. This can be used with or without coolant/air blast, depending on materials being machined.

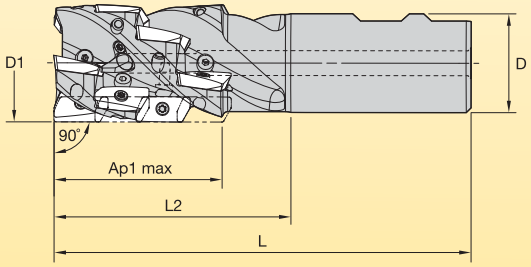
Slotting

Full width cutting or profiling over 50% of the cutter Ø. It is suggested to use coolant or air blast to evacuate chips. If necessary, reduce coolant nozzle hole size, which adds more pressure, and the chip is forced out of the chip gash.

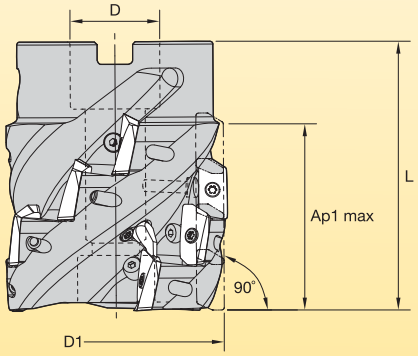


Ramping

Only machine to the depth of the first insert. Observe the ramping angles given in the catalog.



Slotting by Plunging



Slot with the alternate side method, alternating the cuts from side to side. This will enable the cutter to move away from the material prior to moving back up in the Z-axis. The cutter will not be in contact with the workpiece. Follow the direction of the arrows. Move 3 axes simultaneously into the center of the slot. Maximum step over 0.315" (8,0mm).

With multiple Z-axis passes, when the final depth is achieved, move straight back up in the Z-axis, then repeat at the next step over.

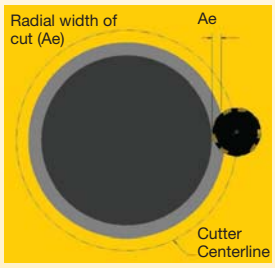
[1] Number of effective flutes.
[2] Mounting style: W = Weldon®; S = Shell Mill.
[3] Max ramp angle when radial depth of cut exceeds 0.31" (8mm)
[4] Max insert corner radius allowed in first row without cutter body modification.
[5] Recommended for profiling applications only.

Profile, Slot, and Ramp

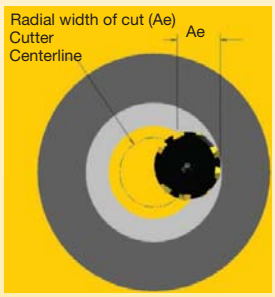


When taking a cut that equals up to 50% of the cutter diameter, you can operate without coolant, unless your material is coolant-dependent. When using more than 50% of the cutter diameter, there is a need to have coolant through the nozzles, or an air blast through the nozzles. This will assist with chip evacuation. Please use the feed table when taking a small percentage of the cutter diameter. This will improve the volume of material removed. To achieve a superior surface finish on the base, adjust the feed to suit the finish required.

When using this cutter for plunging, the maximum suggested step over is .130" (3,30mm). Always try to move the cutter and insert away from the material when retracting in the Z-axis. This can be done when employing the alternate cut method (zig zag method). Use a 3-axis move to get all axes moving at the same time, suggest .010" (0,25mm).

When machining a conventional slot, you have to move straight up in the Z-axis.

Circular and Helical Interpolation



External

When profiling around the external part of a component, it is important to increase the feed rate. This will maintain the chip thickness value.
The programmed feed rate needs to be calculated at the cutter centerline.

For external profiling, adjust the feed rate for feed at the cutter centerline.
Increase the feed rate for external profiling.

Internal

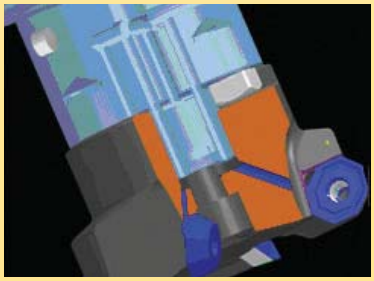
When machining inside a component profile, the area of contact is larger.
The feed rate needs to be at the centerline, and the feed rate needs to be slower.

For internal profiling, adjust the feed rate for feed at the cutter centerline.
This will effectively reduce the feed rate as the distance traveled is less than the peripheral distance.

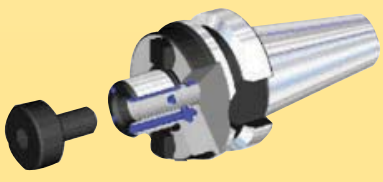
Cutting Data

Reference pages X23–X27 for speed tables. Reference platform pages for feed data. Each insert has an average chip thickness value that will enable you to determine the feed per tooth.

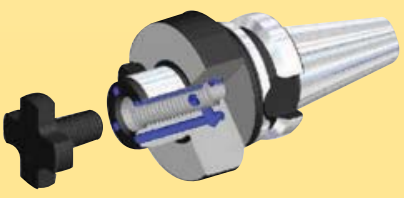
Please remember when using less than 50% of the cutter diameter, the feed rate will need to be increased. Failure to do so will result in premature insert failure.



Running too slowly will reduce tool life.



Spare Parts



Please make sure all the spare parts in the cutters are fully tightened prior to using the product.

Shell mill cutters no longer have coolant grooved bolts. We now have adapters that will enable the coolant to be fed through the adapter pilot diameter.

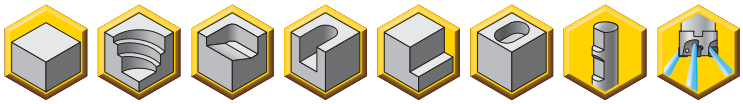
True Through Coolant Shell Mill Adapters

Mill 1-18™

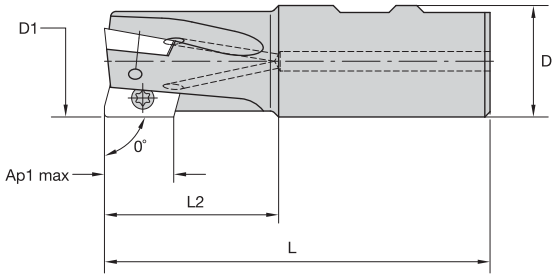
Primary Application

The Mill 1-18 series is a versatile, functional cutter system for a range of cutting tasks. Mill 1-18 cutters can be used for profiling, slotting, ramping, helical interpolation, plunging, and other milling applications. It's a single tool with multi-functional benefits. Mill 1-18 inserts are specially designed to add cutting versatility, especially for larger axial depths of cut. Results include significantly reduced cycle times and lower cutting forces.

Features and Benefits



Features



- Inserts for larger axial depth of cut.
- Inserts radii up to .250" (6,35mm).
- Axial depth of cut up to .708" (18mm).
- Cutter diameters up to 8" (160mm).
- Beyond™ grade technology.

Benefits

- Slotting, profiling, ramping, helical interpolation, and plunging.
- Angled screw for insert retention.
- Insert geometries and grades for most workpiece materials.

- Mill 0° walls.
- Aggressive ramping angles.
- Generates superior surface finish.
- High RPM capabilities.

NOTE: Standard milling cutters will accept insert nose radii up to .079" without modification.
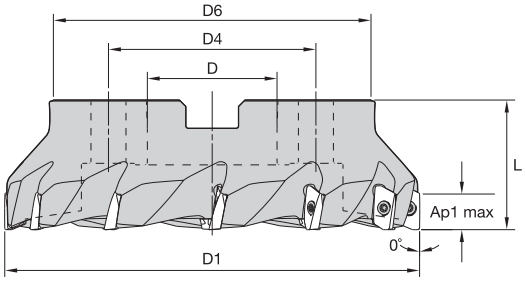
Cylindrical shank with no through coolant.
Cutters designated with the -AL suffix have relieved flutes for aggressive aluminum machining.



Spare Parts

D1	 insert screw	 in. lbs.	 Torx Plus driver
1.000	**MS2126**	35	**DT15IP**
1.250	**MS2126**	35	**DT15IP**
1.500	**MS2126**	35	**DT15IP**

NOTE: Additional insert screws may be ordered in packages of five pieces from catalog number MS2126PKG.

- Mill 0° walls.
- Aggressive ramping angles.
- Generates superior surface finish.
- High RPM capabilities.

- Medium roughing and semi-finishing.
- Solution for austenitic stainless steel and super alloys.
- Medium feed rates.
- PSTS — Precision Pressed and Sintered to Size.
- Ap1 max = .708" (18mm).

Flange Mount Adapters

For HARVI™ Ultra Helical Cutters

HARVI ultra helical cutters can be used with our flange mount adapters to create a powerful combination on nearly all spindle connections on the market.

Our flange mount adapters enable the same cutting tool to be easily adapted to different machine spindle connections.

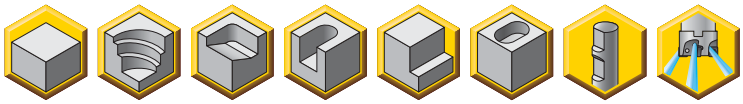
Mill 1-25™

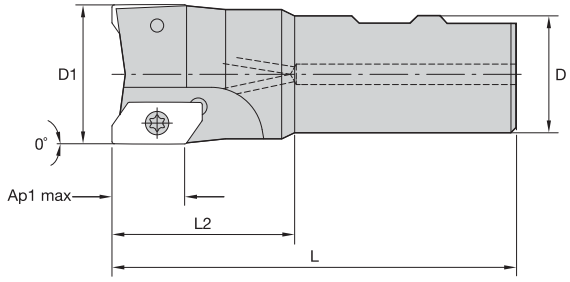
Primary Application

Also known as Mill1 Max, the Mill 1-25 cutter is made specifically for aluminum machining, but can also be used when machining cast iron. High-feed capabilities enable routing applications with an axial depth of cut of up to .98" (25mm).

Features and Benefits



Functions



- Strong, thick inserts over .200" (5,2mm) thick.
- Axial depth of cut up to .98" (25mm).
- Cylindrical, monoblock/HSK63A, CV50, and shell mills.

Benefits

- Made for machining aluminum, but also used for machining cast iron.
- High-feed capability for routing applications.
- Balanced-by-design — if running over 10,000 RPM, balance the cutter assembly.

- For aluminum machining.
- High-speed capability.
- Insert screws should be changed when inserts are changed.

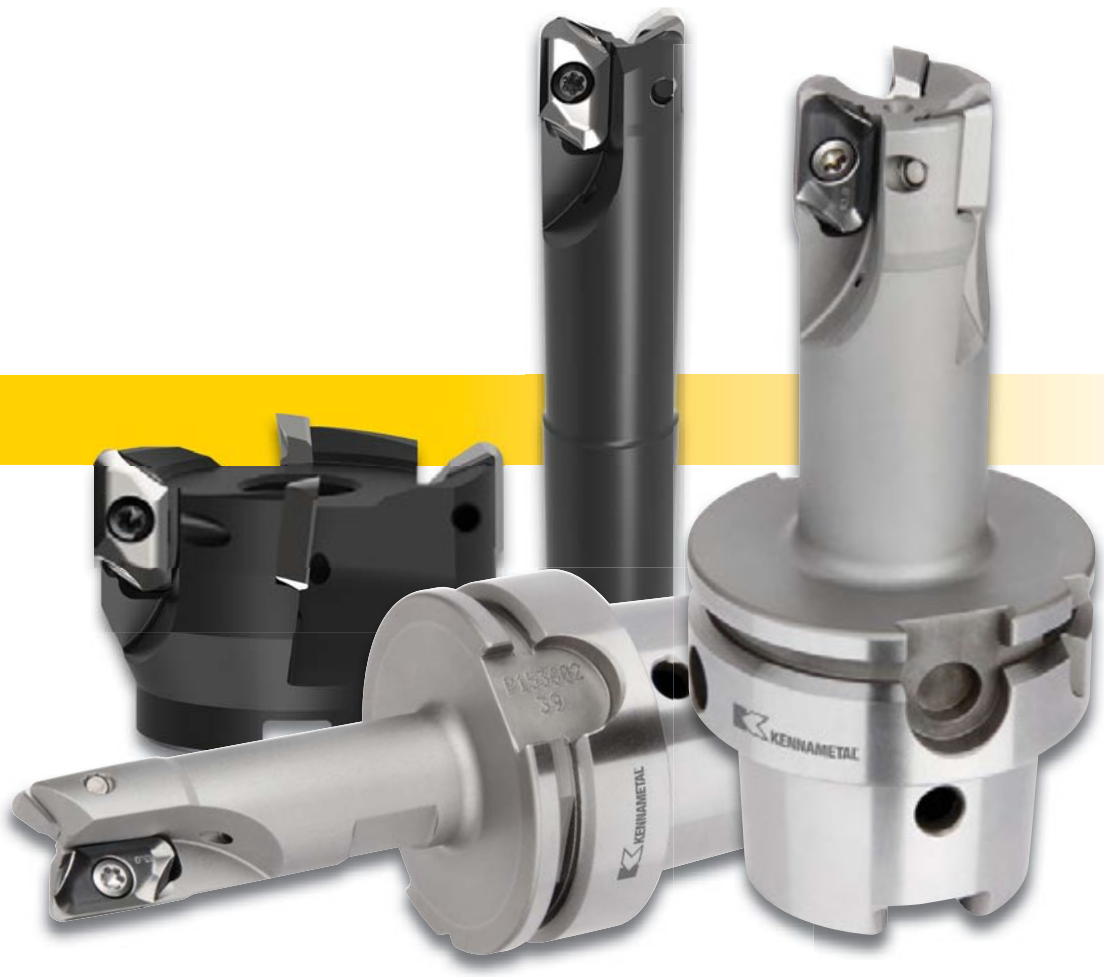
Stellram® 5720VZ16 Series

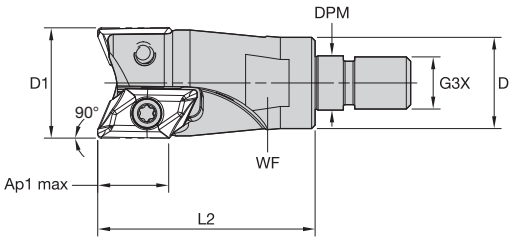
Taking extreme high-speed aluminum machining to the highest level.



Features and Benefits

- Specially designed for machining pockets and profiles on aluminum and aluminum alloys.
- The 5720VZ16 series is designed, manufactured, and tested in accordance with EN ISO 15641:2001 to ensure maximum stability in high-speed applications.
- The internal coolant enables better chip evacuation and higher feed rates.
- The pockets are reinforced to enable for heavy feeding and safe ramping during machining. These features increase tool life and productivity.
- Excellent tools for thin-walled machining due to very low cutting pressure.
- Twelve different insert radii are available, each with the same cutting depth capacity of .630" (16mm).
- Cylindrical shank and HSK63A integral shanks are designed and balanced to G6.3 at 30,000 RPM for diameters up to 50mm. Diameter larger than 50mm are balanced to G6.3 at 24,000 RPM.

Metric monoblock cutters with HSK63A are available as standard in diameters 25, 32, 40, and 50mm.



The Stellram® 5720VZ16 cutters are our latest design for high metal removal in aluminum applications.

Maximum ap = .630"
Diameter Range = 1–3"

- High-speed profiling and pocketing aluminum alloy components in the aerospace industry.
- Maximum stability in high-speed applications.
- Through-tool coolant allows better chip evacuation and higher feed rates.

Screw-On End Mills

order number	catalog number	D1	D	DPM	G3X	L2	WF (mm)	Ap1 max	Z	max ramp angle	lbs	max RPM
5672512	**A5720VZ16SA1.00Z02R2**	1.000	.827	.492	M12	1.969	18	.630	2	14.7°	.23	50000

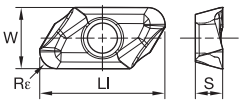
*Max RPM as per ISO 15641
NOTE: It is important to change the screw each time the insert is changed to ensure the highest security.
A dynamometric key and the right torque value are important, also.

Spare Parts

insert screw	Nm	driver
DP5009A	6,0	**TP20**



NOTE: Adjustable torque wrench (order number 6197561) and Torx Plus 20 bit (order number 6205891) may be purchased separately in order to ensure proper torque setting.

(continued)

Machinability

A Excellent
B Good-to-Excellent
C Good
D Not Good

Vc = π x D x n/1000 m/min = mm x RPM

D: Tool diameter, N: RPM, Vc: Cutting speed, π = 3.1416

Choose a cutting speed in the range of values, compatible with the cutter max rotation capacity (engraved on the body) and your spindle stability.

Recommendations for High Speed Machining at 8,000 RPM or above

- Check spindle condition:
  - Runout
  - Clamping of the attachment in traction
  - Marking and cleanliness
- Check that the tool is suitable for the required use.
- Inserts must be locked positively in the pocket and secured using the torx screw provided. The screw must be torqued to the correct value as indicated in the charts on the product pages.
- Because of heavy force to the screw, it is important to change the screw when changing the insert.
- Check the balancing of the assembled tool: cutter body, inserts, and attachment.
- Before start up, note the maximum RPM engraved on the tool. The maximum RPM is linked to a precise balancing value.
- Ensure that the field of application of the tool shown in our technical documents and technological parameters is observed:

A_e (mm)	width of cut, lateral engagement (radial)
a_p (mm)	Axial depth of cut
f_z (mm/tooth)	Feed per tooth
n (RPM)	revolutions per minute

Kennametal cannot accept responsibility for misuse of this product due to:

- Non-observance of the above instructions
- Machine without casing
- Incorrect clamping of workpieces
- No safety device on the machine
- Any misuse or incorrect clamping

The optimum rotation must be determined by condition of the spindle.
The spindle must be rigid to run at these higher RPMs.

Under no circumstances must any attempt be made to repair this tool.
The only permitted maintenance is the indexing or replacement of the inserts.

When assembling the cutter to a Shrink Fit holder, the maximum protrusion cannot exceed 10% of the reach of tool.

Balancing:

- Cylindrical shank and HSK63A integral shanks are designed and balanced to G6.3 at 30,000 RPM for diameters up to 50mm. Diameter larger than 50mm are balanced to G6.3 at 24,000 RPM.
- Cylindrical shank tools mounted in a Shrink Fit holder or any other chuck mill holder + inserts + screws must be re-inspected for balance as an assembly by the end-user when at or exceeding 8,000 RPM. End-user must balance the assembly at a G6.3 at 30,000 RPM maximum.
- Shell mill and modular head cutters are not balanced. These tools must be re-inspected for balance as an assembly, cutter + inserts + screws, by the end-user for high speed machining at 8,000 RPM or above. End-user must balance the assembly at a G6.3 value minimum.
- Balancing requires removing some material by drilling or milling operations. To avoid making modular heads weaker, limit these operations by avoiding high RPM. It is not recommended to remove material by drilling operation.
- For each new modular head added to the same extension, re-balance the assembly. For each new shell mill installed on the same toolholder, re-balance the assembly.

Tighten the modular head to the extension; with lubricant, apply the torque value of:

Thread sizes (mm)	Torque Values Ft. Lbs.
M6	7.37
M8	22.12
M10	36.87
M12	59.00
M16	81.13

Tighten the bolt between the shell mill and toolholder; with lubricant, apply the torque value of:

Thread sizes (inch)	Cutter Bore Size (inch)	Torque Values Ft. Lbs.
0.250	0.500	7.37
0.375	0.750	22.12
0.500	1.000	36.87
0.625	1.250	59.00
0.750	1.500	81.13

Mobile App

The Kennametal mobile app makes it easy to access product information, calculators, and much more from iPhone® and Android™ devices.

FEATURES

Scan a Kennametal tool package barcode or search a product catalog number to access complete product information.

Product information includes tool image, dimensions, grades, and product highlights.

View product availability at global locations.

Get speed and feed information in inch and metric values for all metalcutting products.

View tech tips for helpful solutions to common machining questions.

Contact Customer Support directly from the app.

MACHINING CALCULATORS

View data for milling and drilling applications.

Inch and metric values calculated.

ORDERING

Login using your Konnect credentials to complete a purchase.

WHERE TO FIND IT

Download the free app today from iTunes® or the Google Play™ store.

ANDROID APP ON Google play

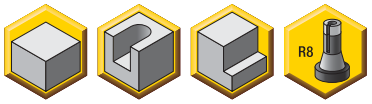
Available on the App Store

KSSM™ Platform

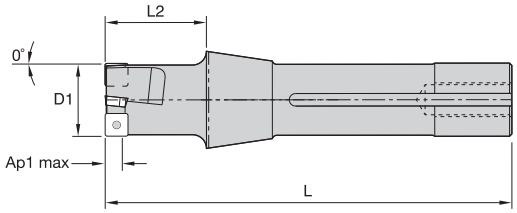
Primary Application

The Kennametal KSSM platform is a versatile solution providing three insert sizes that cover a wide range of applications: face milling, shoulder milling, slotting, profiling, and Z-axis (plunge milling).

Features and Benefits



KSSM IC 10 Inserts



- Four cutting edges.
- Excellent surface finishes.
- Low power requirements.

KSSM IC 12 Inserts

- Four cutting edges.
- Excellent surface finishes.
- Low power requirements.
- Increased depth of cut.

- Mill 90° walls.
- Excellent surface finishes.
- Low power requirements.
- Four cutting edges per insert.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

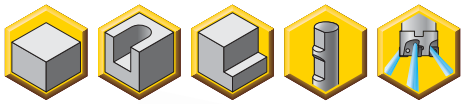
KSSM-KSSP Helical

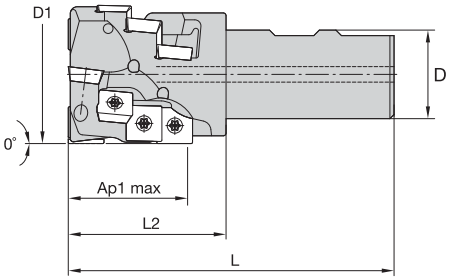
Primary Application

KSSM-KSSP helical cutters were originally developed and proven for the aerospace industry, but are now available for all industries. The proprietary variable rake design minimizes vibration and chatter.

Features and Benefits



Features



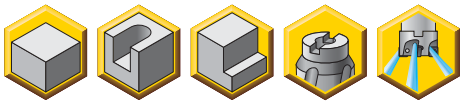
- Patented HARVI™ technology.
- Progressive helical rakes.
- Unique coolant supply.

Benefits

- Increased tool life in titanium.
- Increased metal removal rates.
- Lower power consumption.
- Ensures chip evacuation, even on exotic materials.

- Patented HARVI™ technology.
- Progressive helical rakes.
- Increased metal removal rates (MRR).
- Excellent surface finishes.
- Low power requirements.
- Four cutting edges.

Weldon® End Mills



order number	catalog number	D1	D	L	L2	Ap1 max	Z	Z U	lbs	max RPM

NOTE: Maximum nose radii of lead insert is .094" for a 2" diameter cutter.
All subsequent inserts up the flute should have a maximum nose radius of .031" to avoid lap lines.

Spare Parts

D1	 insert screw	 in. lbs.	 Torx wrench
2.000	**MS1273**	35.0	**TT15**

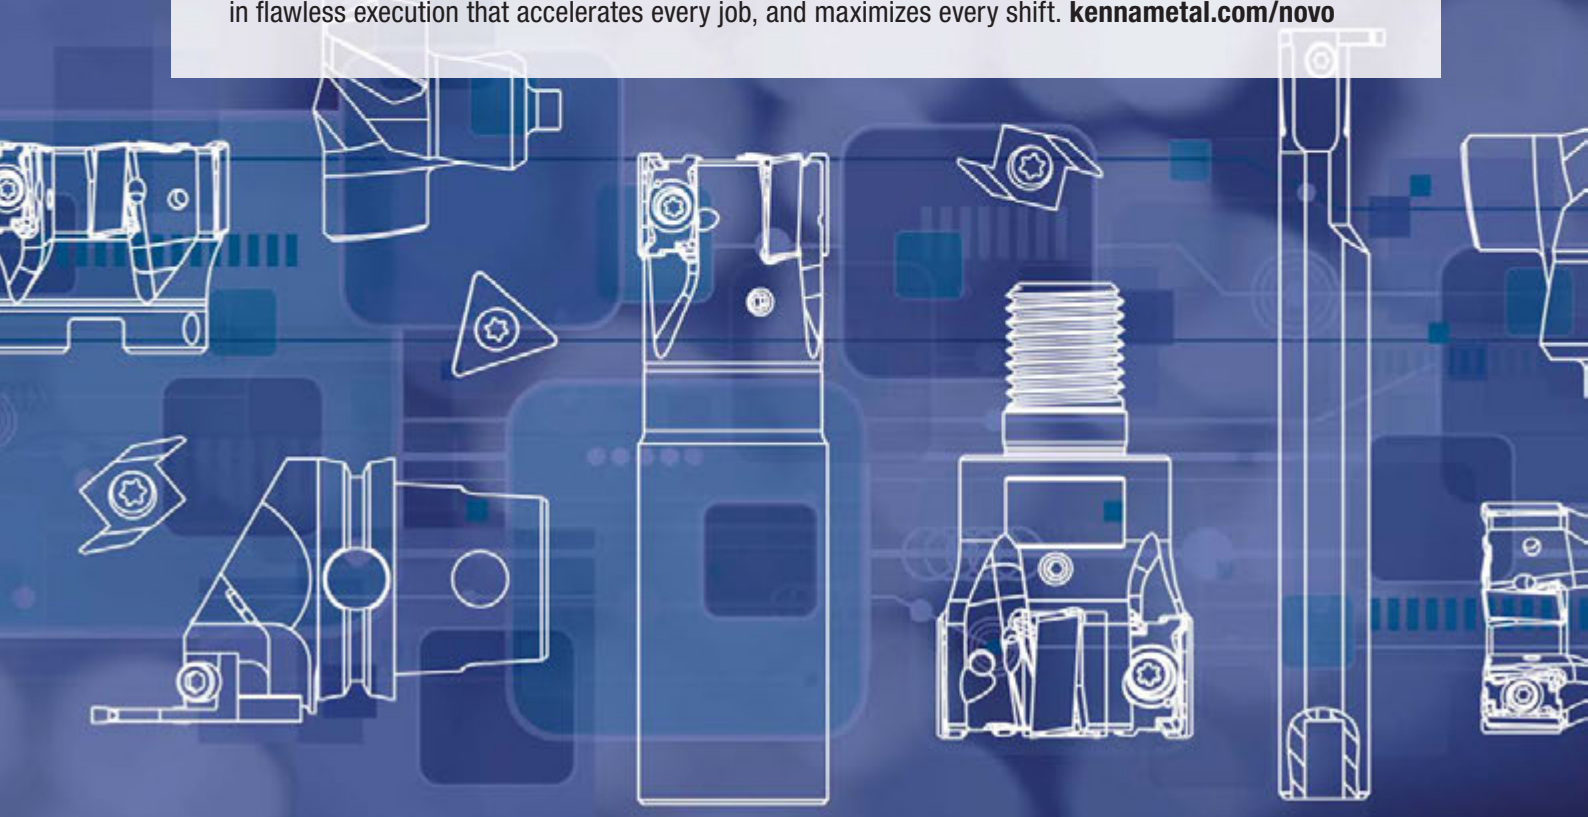
NOVO KNOWS CAD/CAM



With the addition of NOVO™ applications to your team, your CAD/CAM capabilities become much more accurate, streamlined, and productive.

Before NOVO: The programmer would be in their CAD/CAM software, programming a part. Using the tedious method of finding a tool in a catalog, and then manually inputting the tooling information from the catalog into the CAD/CAM software.

The concern is that assumptions are made, and only partial tooling information is entered.

With NOVO: The powerful digital intelligence of NOVO applications not only help the programmer find the right tool for the metalcutting job, but also automatically integrates all the tooling data into a complete CAD/CAM solution. The integration of all the tooling data increases the viability of the part being programmed, and is delivered quickly — saving you time.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximizes every shift. **kennametal.com/novo**

5230VS • High Performance Long-Edge Milling Cutters

The Stellram® **5230VS09** and **5230VS12** cutter series is perfectly suited for profiling and full slotting.

Designed for high material removal rates in titanium and high-temperature alloys. Several applications have achieved metal removal rates of up to two times greater than the previous operating cutting parameters.

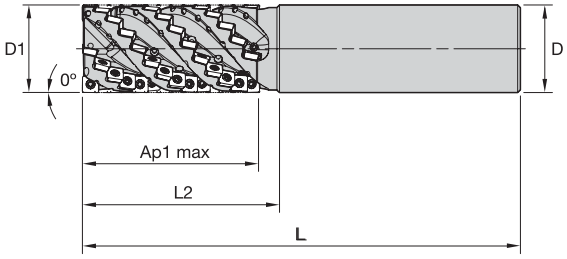
The advanced chevron design ensures that one cutting point is always in contact with the material during entrance and exit. This provides optimum harmonic stability resulting in maximum tool life and a 30% improvement in surface finish. A generous flute capacity, coupled with each cutting edge having its own coolant jet, ensures excellent chip evacuation. This works to enhance surface finish and increases metal removal rates for a higher level of productivity.

The advanced 5230VS series is ideal for rough machining of steel, alloyed steel, stainless steel, and particularly for titanium and high-temperature alloys.

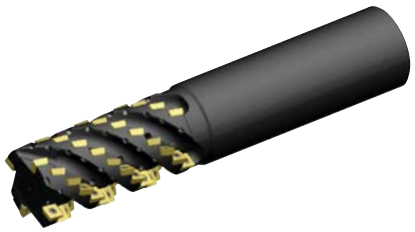
Features and Benefits

- Insert positioning provides smooth, progressive penetration and cutting action for extended tool life.
- Individual coolant jets to each insert provides constant chip evacuation and temperature stability in the cutting zone.
- The advanced chevron design improves stability and lowers power consumption, increasing tool life up to two times greater than comparable cutter in today's market.
- Proven versatility in wide application area in titanium and high-temperature alloys increasing productivity.

5230VS



5230VS09:
(a_p max is determined by selection of cutter diameter)
Diameter range and maximum a_p= 2.000" diameter with a_p 2.010", 3.150" or 4.000"



5230VS12:

(a_p max is determined by selection of cutter diameter)
Diameter range and maximum a_p= 2.500" diameter with a_p 2.244" or 3.700"
3.000" diameter with a_p 2.560" or 4.433"
4.000" diameter with a_p 3.000" or 5.236"

- High material removal rates in titanium and high-temperature alloys.
- Chevron design improves stability and lowers power consumption.
- Insert positioning provides smooth, progressive penetration and cutting action for extended tool life.
- Individual coolant jets to each insert provide constant chip evacuation and temperature stability in the cutting zone.

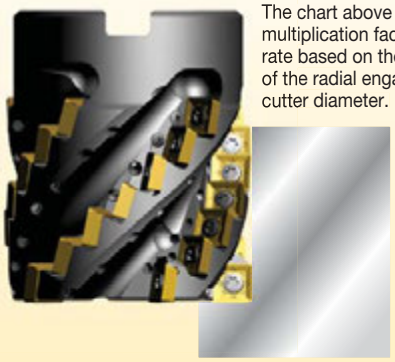
NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Calculation of the average chip thickness in relation with the a_e (Radial Engagement) if a_e is less than 50% of diameter.

Formula: Program Feed Rate (f_z)

$$f_z = h_m \times \sqrt{\frac{d}{a_e}}$$

h_m = Average chip thickness
a_e = Radial engagement
f_z = Feed per tooth
d = Cutter diameter

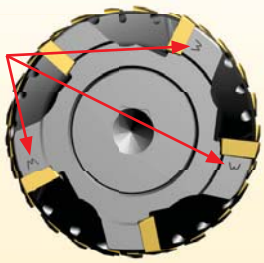


Formula: Average Chip Thickness (h_m)

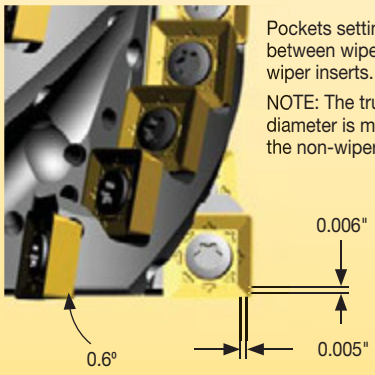
$$h_m = f_z \times \sqrt{\frac{a_e}{d}}$$

h_m Correction Coefficient Chart

Cutter Ø 2.000"			Cutter Ø 2.500"			Cutter Ø 3.000"			Cutter Ø 4.000"		
ae%	ae (Inch)	Coefficient Factor	ae%	ae (Inch)	Coefficient Factor	ae%	ae (Inch)	Coefficient Factor	ae%	ae (Inch)	Coefficient Factor
5	0.100	2.294	5	0.125	2.329	5	0.150	2.294	5	0.200	2.294
10	0.200	1.667	10	0.250	1.667	10	0.300	1.667	10	0.400	1.667
15	0.300	1.400	15	0.375	1.425	15	0.450	1.407	15	0.600	1.407
20	0.400	1.250	20	0.500	1.250	20	0.600	1.250	20	0.800	1.250
25	0.500	1.155	25	0.625	1.160	25	0.750	1.155	25	1.000	1.155
35	0.700	1.048	35	0.875	1.056	35	1.050	1.048	35	1.400	1.056
50–100	1.000–2.000	1.000	50–100	1.250–2.500	1.000	50–100	1.500–3.000	1.000	50–100	2.000–4.000	1.000



Example: A 3.000" diameter cutter using a 0.300" radial engagement (ae) = 10% of the cutter diameter. At 10%, your coefficient is 1.667 (see above table); therefore you must multiply your feed rate by 1.667 for correcting the feed for profiling.



The chart above shows the multiplication factor for the feed rate based on the percentage of the radial engagement of the cutter diameter.

Wiper pockets are identified with a **W** engraved on the face of the body.

The 5230VS cutter series is designed with wiper pockets which provide a much better face surface finish. The non-wiper pockets generate the 90° corner. The same inserts can be utilized in all pockets.

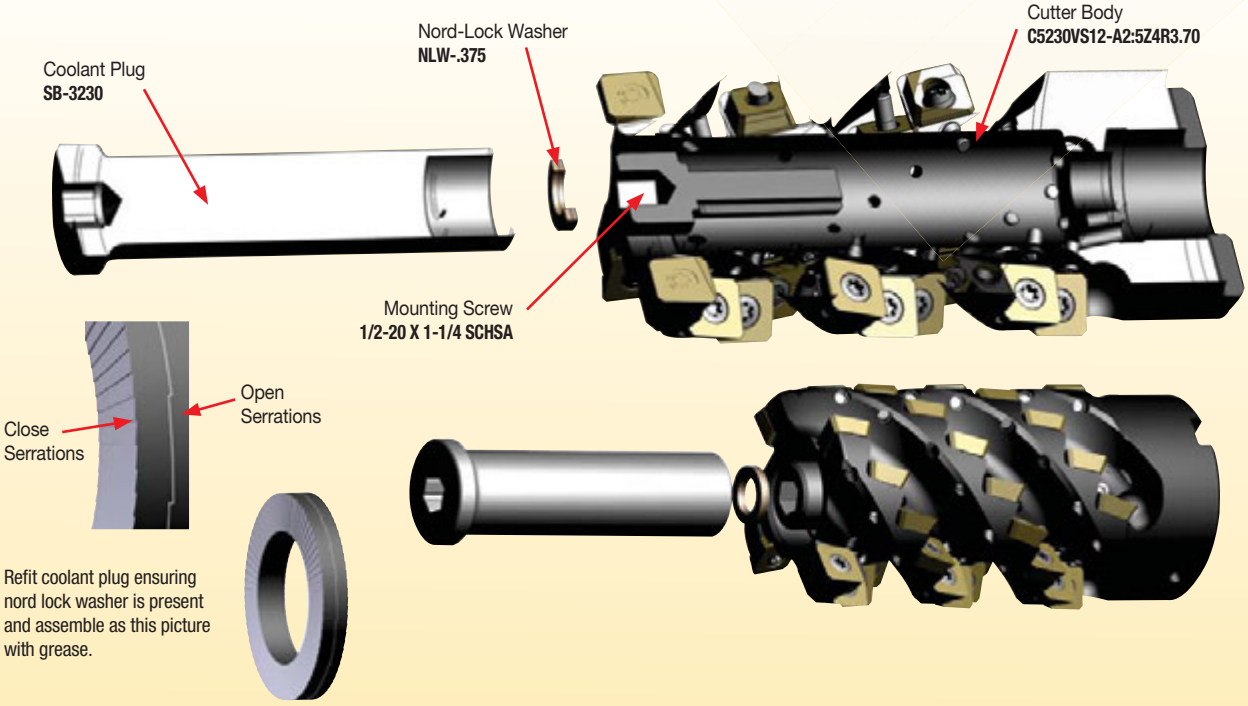
Pockets setting difference between wiper and non-wiper inserts.

NOTE: The true cutter diameter is measured at the non-wiper pockets.

Non-wiper pocket positions are set back and square to axis to give a true 90° approach.

Wiper pocket positions are in front and angled to allow facing.

Cutter diameter (inch)	Number of Wiper Inserts
2.000	2
2.500	2
3.000	3
4.000	3



5230VS09 and 5230VS12 Fitting Instructions for Shell Mill Cutters

NOTE: All Shell Mill 5230VS09 and 5230VS12 chevron porcupine cutters are supplied assembled with mounting bolt, nord-lock washer, and steel coolant plug.

Please follow the instructions below to disassemble the cutter, attach the cutter to a shell mill adapter, and reassemble coolant plug. It is very important to use the proper torque when reassembling the cutter with the mounting bolt, nord-lock washer, and coolant plug.

Example of cutter: C5230VS12-A2.5Z4R3.70 assembly

Refit coolant plug ensuring nord lock washer is present and assemble as this picture with grease.

1. Remove coolant plug. *(NOTE: Ensure the nord-lock washer is retained to the bottom of the coolant plug.)*
2. Fit the cutter body to the shell mill adapter and secure using the mounting bolt supplied with the cutter.
   NOTE: The mounting bolt must be properly torqued to the specific torque setting shown in Detail 1 on page T136.
3. Refit coolant plug ensuring nord-lock washer is present and in the proper location on the bottom of the coolant plug. A small amount of grease can be used to hold the nord-lock washer in place.
4. Tighten coolant plug with specific torque setting shown in Detail 2 on page T136.
5. NOTE: If axial depth of cut (a_p) is less then maximum a_p of cutter, then **F3006T** coolant control screws supplied separately can be used to block coolant holes forcing more coolant to the front of the cutter. If these screws are used, please secure with loctite or similar product.

Torque values for mounting bolts

Excessive condition is when long reach extensions are required or when cutting parameters are elevated to extreme parameters.

Carbide Recycling

Help preserve and protect our planet!

It's easy for your company to be environmentally conscious with the Kennametal Carbide Recycling Program.

By sending us your used carbide tools, you help preserve and protect the environment and ensure that these products are recycled responsibly. Kennametal accepts any coated or non-coated carbide items, including inserts, drills, reamers, and taps.

By using the Kennametal Carbide Recycling Program, you will receive:

- A partner who cares about a sustainable environment.
- Easy-to-use web portal to value your used carbide.
- Access to our popular Green Box™ options for carbide collection.
- Systematic and efficient disposal of carbide materials.
- Improved profitability.

Program is not currently available in all geographical areas.
For more information, please visit **kennametal.com/carbiderecycling**.

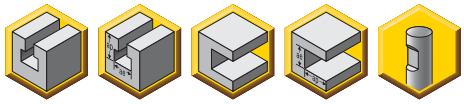
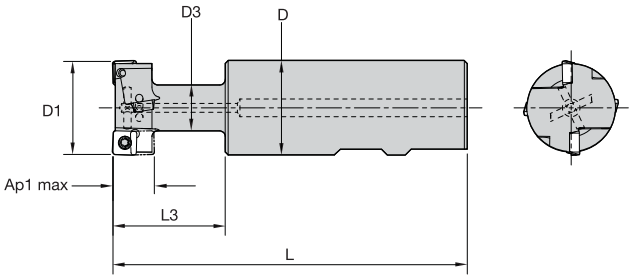
KTMS™ Slotting Cutter

Primary Application

KTMS slotting cutters produce “T” slots in machine beds as well as small radial depths of cut for machining shallow radial slots. There is always a need to prepare the slot before using this type of cutter — preparation is the key to success. See the technical information for information about the pre-machining on page U5.



Please note that all of these cutters have metric diameters, speeds, and feeds.



Features and Benefits

- Only available in metric dimensions.
- Slot widths from 9–22mm.
- Three different insert sizes.
- Preparing the component before slotting is the key to success.
- Prepare workpiece with a slot.
- Honed insert edges.
- Feed rates between 0,10–0,15mm; lower feed rates will induce vibration.
- Use air flow to evacuate chips.
- Always start the cutting process with a new cutting edge.

- Prepare workpiece with a slot.
- Honed insert edges.
- Feed rates between 0,10–0,15mm; lower feed rates will induce vibration.

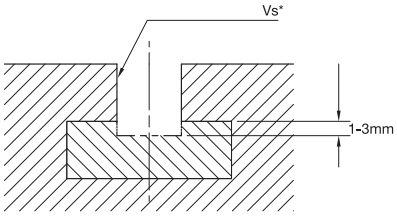

Fig. 1

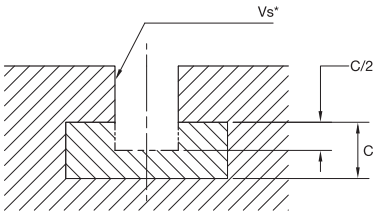

Fig. 2

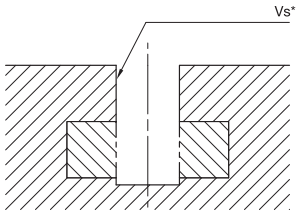

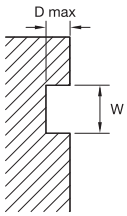

Fig. 3

Side Slotting

Steel

- Machining a vertical slot, depth to be kept at a minimum as shown in Figure 1.
- If the depth is greater than Figure 1, chip evacuation problems could occur.
- Vibrations could occur when the T-slot cutter diameter increases; use Figure 1 as the starting point.
- If chattering is a concern, adopt the Figure 2 solution.

Cast Iron

- Fewer problems with chip evacuation, and reduced cutting forces enable deeper vertical slots as shown in Figures 2 and 3.
- Air blast is recommended to disperse the chips; this can be used for steel and cast iron.

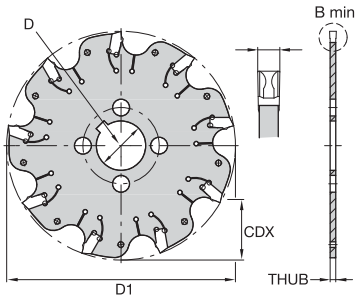
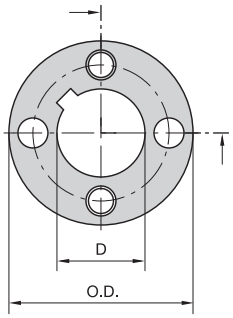
KVNS™ Slotting Cutter

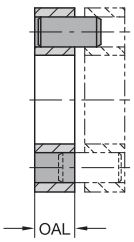
Primary Application



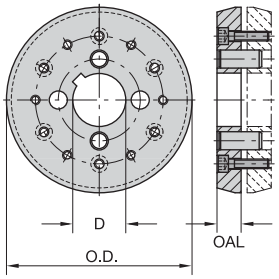
The KVNS slotting cutter enables diameters from 2.50–10" and insert widths from .063–.245". It is a perfect solution for small groove widths, grades, and geometries and suits most materials. Drive rings and support rings are available; use these items to get the maximum support for the cutter body.



Features and Benefits



- Slot widths from .063–.245".
- Grades and geometries to suit most workpiece materials.
- Self-clamping inserts.
- Positive chipforming inserts are standard.
- Self-clamping insert seat with fixed stop.
- Excellent for all flat-bottom slotting and cut-off operations.
- Two drive hubs required for each cutter body, except when using two drive supports.
- Drive rings and support rings available, must be ordered separately (in pairs).



- .063–.245" slot width range.
- Positive chipforming inserts are standard.
- Self-clamping insert seat with fixed stop.
- Excellent for all flat-bottom slotting and cut-off operations.
- Two drive rings required for each cutter body, except when using two drive supports (must be ordered separately, in pairs).

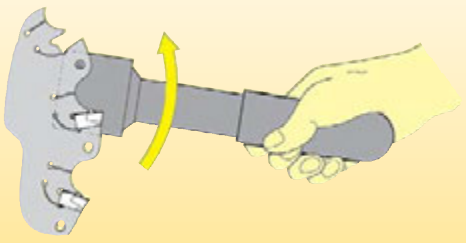
NOTE: Use "Light Machining" values as starting feed rate.
% = ae/Dc * 100 (ae = radial depth of cut, Dc = cutting diameter)
Please see pages X22–X37 for recommended starting speeds.



Slotting Cutters • Technical Information

Slot Milling

Secure clamping self-clamping insert seat for maximum machining safety

Using the assembly wrench:
Fitting the insert

Removing the insert

- Exact position of the insert guaranteed by the positive stop.
- Maximum possible insert repeatability with dual positive prism clamping.
- Powerful, secure clamping guarantees high peripheral speeds.

FIND THE LATEST PRODUCT INFORMATION

Whether your operation is turning, milling, or holemaking, Kennametal brands are the high-performance tooling you need. We offer standard and custom solutions for a wide range of applications.

Find information about our most current campaigns and catalogs.

Register on Konnect for the full functionality of the Kennametal online ordering website.

CONTACT US

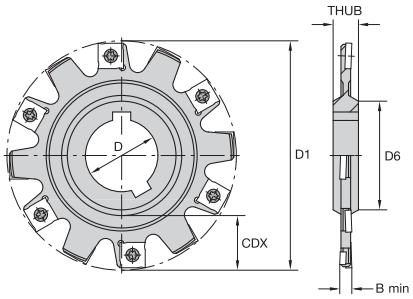
Our customers are important to us. We want to provide you the best customer service in the industry. If you have a comment or question, please send it to us. We strive to respond to all inquiries within 24 hours.

FIND A LOCAL AUTHORIZED DISTRIBUTOR IN YOUR AREA

Kennametal offers world-class products and services globally. Our distributors know us, and more importantly, they know you. They know better than anyone in the industry how to put the global power of Kennametal to work for you — in your industry, in your region, and for your business.

SN Slotting Cutter

Primary Application



SN slotting cutters are perfect for deeper applications that require the cutting load to be shared from one insert to the other. Provides groove widths from .161–.187" and cutter diameters from 4–6" as well as an economical way to achieve balanced cutting.

Features and Benefits

- Cutters available in arbor mount.
- Inserts with four indexes.
- Staggered key ways in mounting bore, used for multiple ganged cutters.
- Slot width .161–.187".
- Three insert geometries available: -GP, -GE, and -T.
- Requires only one spare part.

- .161–.187" slotting width range.
- Four indexes per insert.
- Three chipformers available.
- Two keyways for staggered mounting.
- Requires only one spare part.

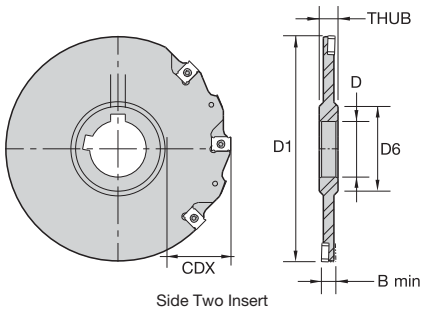
LN Slotting Cutter

Primary Application



LN slotting cutters offer arbor and shell mill cutter options, groove widths from .250–.539", and cutter diameters from 3–8". Easy to adjust radially in .020" increments.

Features and Benefits

- Cutter available in arbor and shell mounts.
- Groove width .250–.500".
- Groove width can be increased by .020" or .040". Please consult the charts “Technical Information: Possible Insert Combinations”. NOTE: This involves changing the insert and insert screw.
- Easy width adjustment through insert thickness.
- Staggered internal keys.
- Positive chip grooves.
- Full side cutting.
- Neutral and positive chip forming inserts are standard.
- Four insert cutting edges.
- Requires only one spare part.

- .250–.500" slot width range.
- Easy width adjustment through insert thickness.
- Full side cutting.
- Neutral and positive chip forming inserts are standard.
- Four insert cutting edges.
- Two keyways for staggered mounting.
- Requires only one spare part.
- Base slot angle: 2°.
- Maximum slot width tolerance: +/- 0,001".

- Easy width adjustment through insert thickness.
- Full side cutting.
- Neutral and positive chip forming inserts are standard.
- Four insert cutting edges.
- Requires only one spare part.
- Base slot angle: 2°.
- Maximum slot width tolerance: +/- 0,001".

- Utilizes wider inserts in standard cutter bodies.
- Cutting width of the unique LNE insert style for narrow slotting cutters can be varied by using an insert one size thicker.
- The width can be increased in .020" or .040" increments.
- Refer to the insert combination in the table “LN Slotting Cutter Widths” for insert and screw selection.

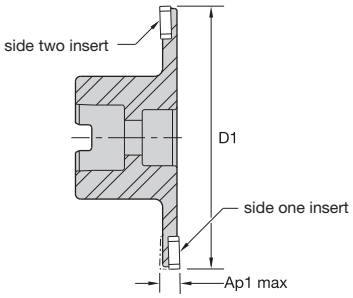
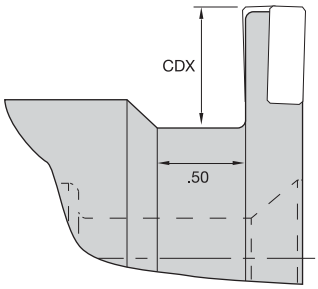
Example: Cutting Width of .289"



cutter catalog number	D1	Ap1 max (new)	side one insert*	screw**	side two insert*	screw**
KS34LNE	3.000	.289	LNE1245	MS-1282	LNE1245	MS-1282



*Caution variation in cutting width range is limited to one size (thickness) greater than the standard insert thickness.

**When changing to wider insert thickness, use the necessary longer screw.

NOTE: When cutters have 3 rows of inserts, the above table only refers to the outer insert on both sides of the cutter. When using inserts that employ a radius of .094" or .125", the corner radius under the insert on the cutter body must be modified to a .10" radius or an optional .10" x 45° chamfer; see chart for detail.

- Utilizes wider inserts in standard cutter bodies.
- Cutting width of the unique LNE insert style for narrow slotting cutters can be varied by using an insert one size thicker.
- The width can be increased in .020" or .040" increments.
- Refer to the insert combination table below for insert selection.

NOVO KNOWS CAD/CAM

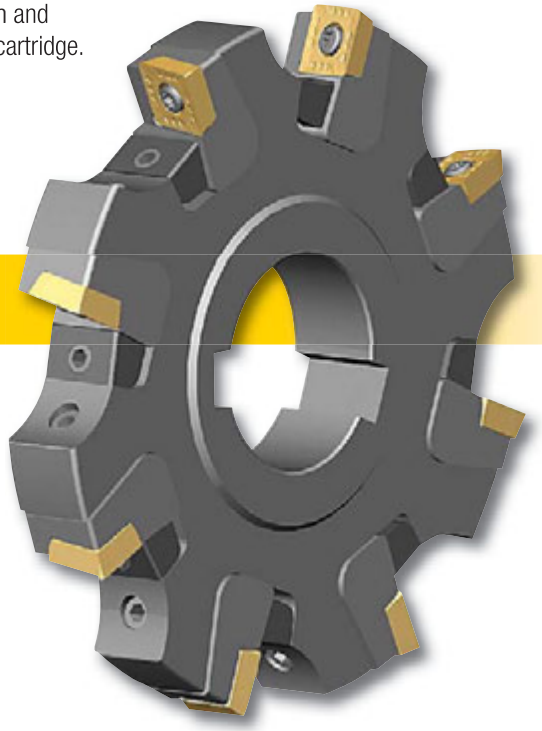
With the addition of NOVO™ applications to your team, your CAD/CAM capabilities become much more accurate, streamlined, and productive.

Before NOVO: The programmer would be in their CAD/CAM software, programming a part. Using the tedious method of finding a tool in a catalog, and then manually inputting the tooling information from the catalog into the CAD/CAM software.

The concern is that assumptions are made, and only partial tooling information is entered.

With NOVO: The powerful digital intelligence of NOVO applications not only help the programmer find the right tool for the metalcutting job, but also automatically integrates all the tooling data into a complete CAD/CAM solution. The integration of all the tooling data increases the viability of the part being programmed, and is delivered quickly — saving you time.

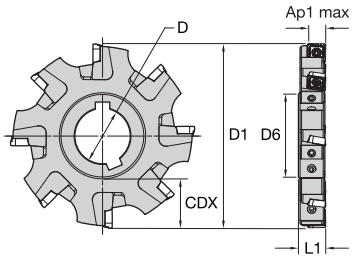
NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximizes every shift. **kennametal.com/novo**



KSSM™ Slotting Cutter

Primary Application

Cutters available in fixed and adjustable groove widths:



Cutters available in arbor and shell mounts, as well as in fixed and adjustable groove widths, with insert grades and geometries for most materials, KSSM fixed-width slotting cutters are a cost effective solution for the general engineering market. Very precise adjustments to achieve consistent widths are possible with the variable width and enable you to change the tool from right hand to left hand with a change of cartridge.

Features and Benefits

- Cutters available in arbor and shell mounts, as well as in fixed and adjustable groove widths.
- Maximum groove widths:
  - — Fixed cutters IC 10: .359" and .614".
  - — Fixed cutters 1/2" IC: .461" and .739".
  - — Adjustable cutters IC 10: .551–.709".
  - — Adjustable cutters 1/2" IC: .709–.917".
- Rapid adjustment mechanism.
- Large selection of insert geometries and grades to cut most workpiece materials.
- Four insert cutting edges.
- Faceted inserts for superior surface finish.
- Cutter diameter range is 4–12".
- Insert corner radii from 0.016–0.125".

- Right-hand and left-hand cutters with .359" width of cut.
- Large selection of insert geometries and grades to cut most workpiece materials.
- Four insert cutting edges.
- Insert radii available.
- Faceted inserts for superior surface finishes.

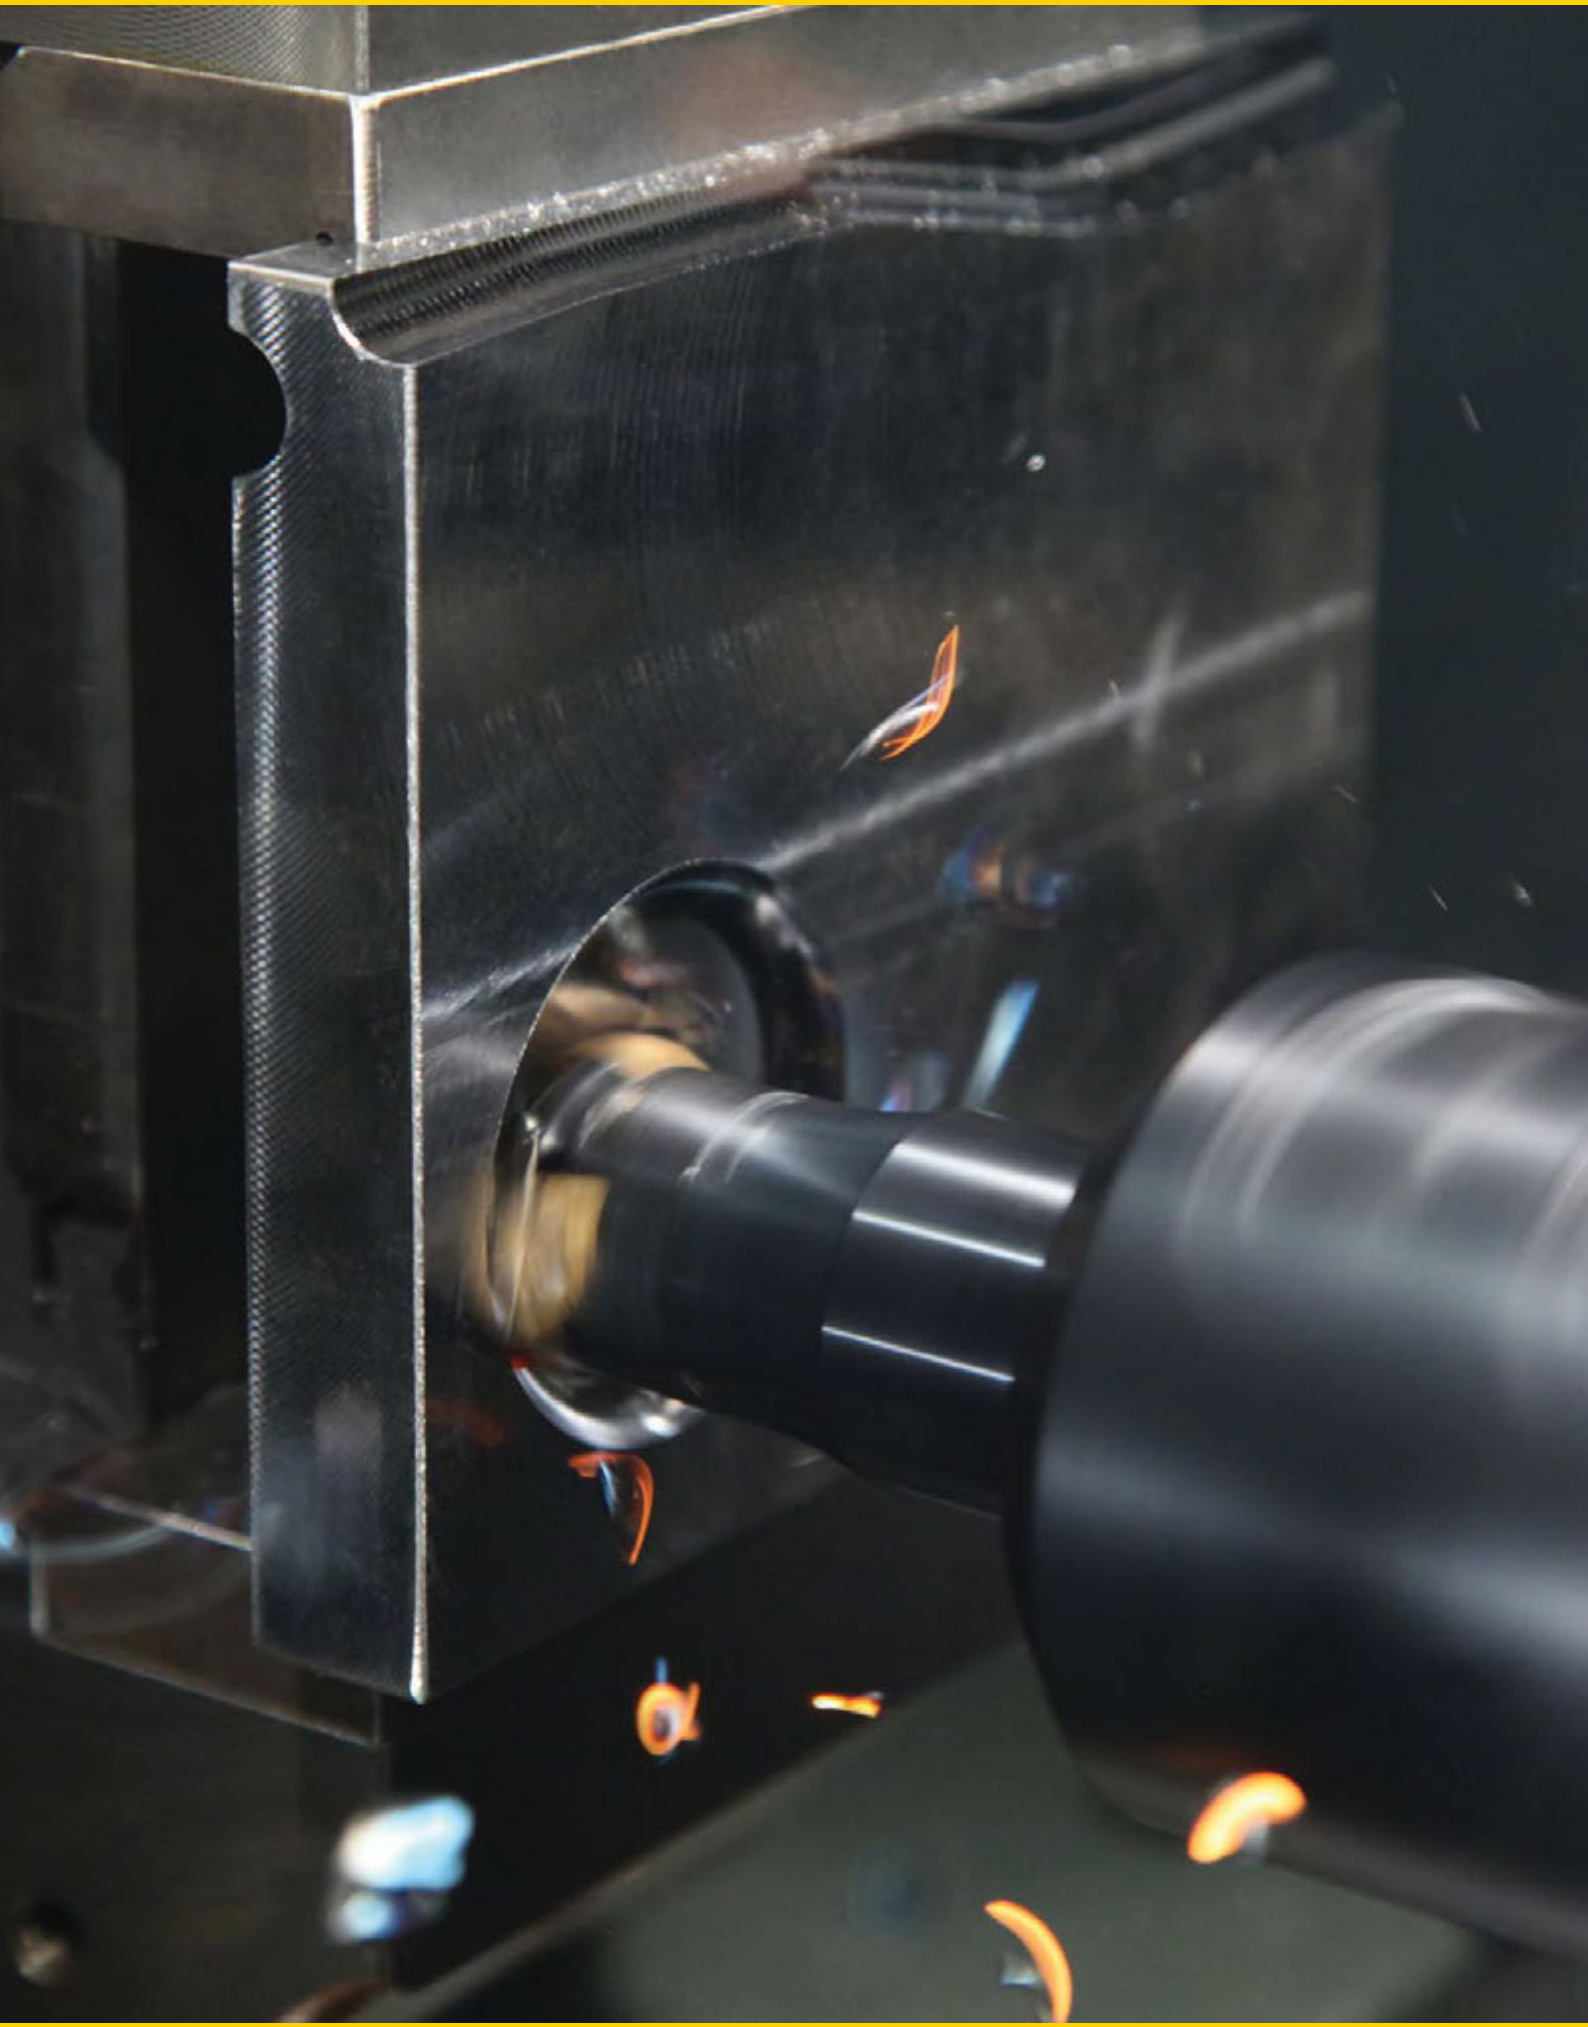
NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

KSSM Slot Width Adjustment Instructions



1. Measure body width at pocket 1 (per stamp on tool body) behind cartridge.
2. Zero tool presetter at pocket 1 behind cartridge.
3. Move presetter over the insert and set distance Y. Y= (Desired Slot Width-Body Width)/2
4. Zero over insert at starting pocket (pocket 1).
5. Adjust remaining cartridges on the same side.
6. Return to starting pocket and start with step 2 for opposite side of cutter.

KSSM Cartridge Adjustment Instructions

1. Insert 3mm hex wrench into STCM Screw.
2. Rotate 3mm hex wrench counter-clockwise to loosen wedge.
3. Rotate 3mm hex wrench clockwise to lightly tighten STCM screw to approximately 9 in. lbs., so the wedge is touching the cartridge and cutter body. This creates some slight resistance against the cartridge during the adjustment.
4. Insert hex wrench into cam pin behind cartridge.
5. Rotate wrench to adjust cartridge to desired position.
6. For best accuracy, back cam pin off, so you can feel it is not touching the sides of the slot in the back of the cartridge.
7. Remove wrench from cam pin.
8. Insert 3mm hex wrench into STCM screw.
9. Tighten STCM screw to 55 in. lbs. prior to using the cutter. Kennametal torque wrench KTW45 or alternate torque wrench should be used.
10. Double check cartridge position to assure no movement.

Stellram® 7792 High-Feed Series

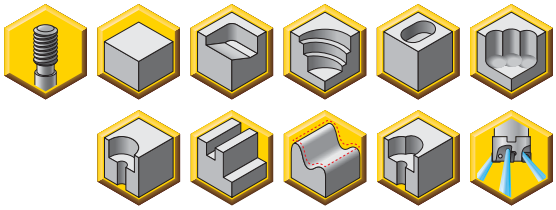
Indexable Milling

The 7792 cutter series has been designed for high-feed milling applications with superior surface generation. 7792VX cutters are designed for a wide range of applications, including facing, pocketing, ramping, helical interpolation, and plunging. They are capable of machining all materials, including steel, stainless steel, cast iron, and high-temperature and aluminum alloys.

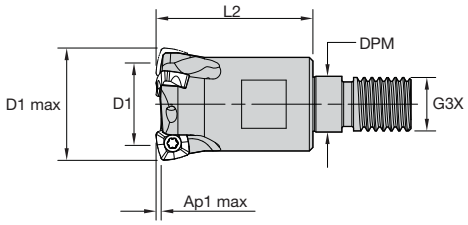
Features and Benefits

- The 7792VX high-feed cutters are the best solution for reducing cycle times or removing the maximum amount of material in the shortest time.
- New ultra-fine pitch cutters further increase metal removal rates, especially in high-temp alloys.
- The unique design and insert positioning help to achieve up to 5x higher feed rates than other cutters on the market.
- When used in long (extended) toolholders, 7792VX cutters absorb vibrations and greatly reduce instability and tool deflection.
- Integrated wiper facet for improved surface finish: 16 Ra (1,6µ) when used at <0.020 in/z.

7792VXP06:
Maximum ap = 0.035"
Diameter Range = 0.625–1.250"



7792VXD09:
Maximum ap = 0.059"
Diameter Range = 1.000–2.000"



7792VXD12:
Maximum ap = 0.098"
Diameter Range = 1.250–6.300"

7792VXE16:
Maximum ap = 0.138"
Diameter Range = 2.000–6.000"

NOTE: Larger diameter shell mill fixation cutters with interchangeable cartridges are available.

- Ultra-fine pitch cutters available to increase material removal rates, especially on high-temp alloys.
- Positive design to support lower cutting forces and long overhang usage.
- Ramping and plunge milling capabilities.
- Screw-on cutters provide better rigidity and stability when used with small spindels: BT30, BT40, DV40, HSK50, HSK63, etc.
- Screw-on cutters can be less expensive when compared to cylindrical shank cutters due to their higher flexibility through multiple holder combinations.

NOTE: For further details about using the 7792VX series in plunging operations, please see page V30.
Use "Light Machining" values as starting feed rate
Please see pages X22–X37 for recommended starting speeds.

- Ultra-fine pitch cutters available to increase material removal rates, especially on high-temp alloys.
- Positive design to support lower cutting forces and long overhang usage.
- Ramping and plunge milling capabilities.
- Screw-on cutters provide better rigidity and stability when used with small spindels: BT30, BT40, DV40, HSK50, HSK63, etc.
- Screw-on cutters can be less expensive when compared to cylindrical shank cutters due to their higher flexibility through multiple holder combinations.

NOTE: For further details about using the 7792VX series in plunging operations, please see page V30.
Use "Light Machining" values as starting feed rate
Please see pages X22–X37 for recommended starting speeds.

Copy Milling

- Ultra-fine pitch cutters available to increase material removal rates, especially on high-temp alloys.
- Positive design to support lower cutting forces and long overhang usage.
- Ramping and plunge milling capabilities.
- Screw-on cutters provide better rigidity and stability when used with small spindels: BT30, BT40, DV40, HSK50, HSK63, etc.
- Screw-on cutters can be less expensive when compared to cylindrical shank cutters due to their higher flexibility through multiple holder combinations.

NOTE: For further details about using the 7792VX series in plunging operations, please see page V30.
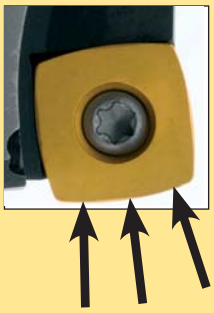
Use “Light Machining” values as starting feed rate
Please see pages X22–X37 for recommended starting speeds.

Plunging

The cutting edge should not be in contact with the material face after machining to maintain the cutting edge quality.

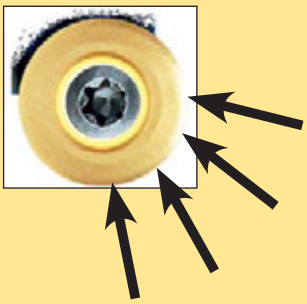
The scallop height is calculated in relation to the step over.



The maximum radial engagement is directly in relation to insert cutting edge length.

For insert type:
XP…06 the ae max is .118"
XD…09 the ae max is .236"
XD…12 the ae max is .354"
XE…16 the ae max is .512"

The advantages of face milling and producing cavities with the Stellram® high-feed face mill are numerous.
The unique design of the insert, approach angle, and the cutter body ensure the cutting forces are predominantly directed in the axial direction. The example shown with a round insert tool shows complex forces which result in high levels of vibration and damage to the cutting edge.



7792VX

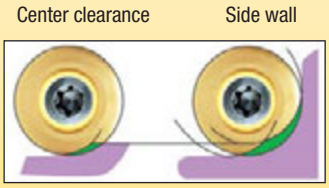
- Cutting forces predominantly axial.
- Relationship between cutting edge and workpiece is at its most stable.
- Results in high feed rates and consistent tool life.

Round Insert Tools

- Tangential forces act around the radius.
- Leads to vibration and damage of the cutting edge.
- Leads to reduced feed and lower productivity.

The 7792VX machines with a constant volume of chip throughout all aspects of producing cavities and produces a side wall that is close to profile.

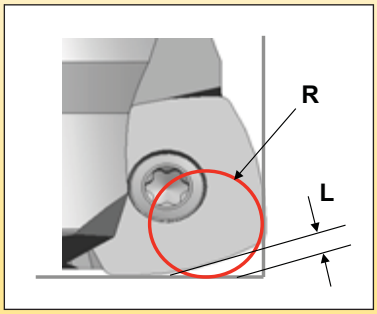
7792VX



- Constant cutting section (chip volume) irrespective of position in cavity.
- Producing a close to profile side wall.
- Near-square side walls possible.

Round insert tools have increasing chip volume through the process.

Round insert

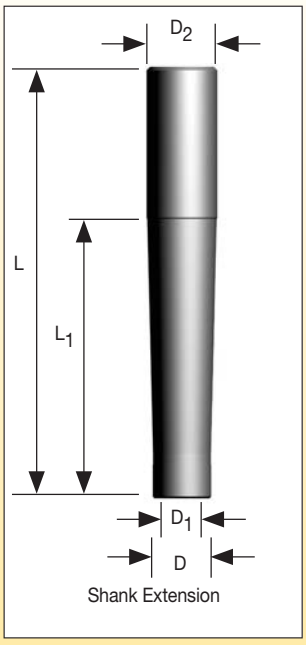


- Greater surface contact.
- Increased chip section for side wall machining.
- Vibration in corners.
- Undulating side wall cusps.

CNC Program • Corner Radius Definition

The use of common CAD/CAM systems requires a round insert dimension to be known for cavity machining. This is available with 7792VX cutters as shown below and in the reference table.

For finish pass applications:
Wiper facet for finishing use max. feed 0.031"



Programming Data (inch)			
Insert corner nose size (IC)	Rε	R	L
06	0.750	1.100	1.420

NOTE: Order example with cylindrical shank: M-13-M8-CA.625-3.543.

Shank Extension

Cylindrical shank extensions can be used with all modular heads found in several product family series within this catalog.

These extensions have the industry standard of metric threads.

Technical Advice

M	Modular adapter
13	Diameter in front of the modular shank (D) = 0.512" (13mm)
M8	Metric Thread (M)
CA.625	Cylindrical shank diameter 0.625" with through coolant
3.543	Total length of the body in Inches

NOVO KNOWS SEARCH

Searching for a tool has been enhanced by Advise and Select functions from NOVO™ applications — saving you time and money.

ADVISE

Uses a rules-based approach to provide cutting tool recommendations:

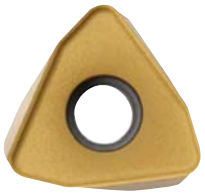
- Define Machining Feature (face milling, slotting, blind hole, etc.)
- Apply Constraint Requirements (geometric, material, tolerance, etc.)
- Set Machining Sequence (single or multi-step operations, rough then finish, etc.)
- Receive Ranked Results

SELECT

A method of selecting cutting tools from a tree structure via a hierarchy or parametric search:

- If you know which product you are looking for, a quick search can be performed by just the catalog number or product description.
- Smart filters significantly reduce the amount of potential tooling solutions.
- After the tool is selected, NOVO also provides cutting and adaptive item options that fit with your solution.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximizes every shift. **kennametal.com/novo**

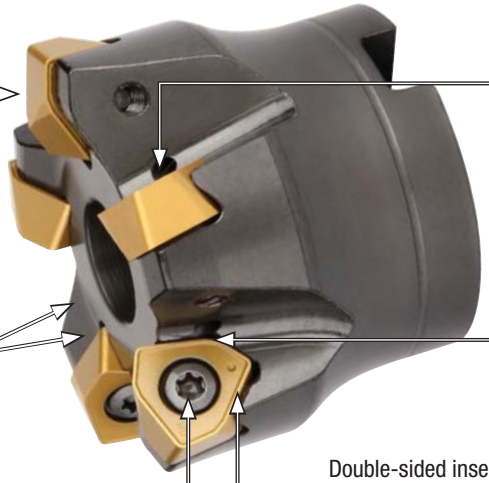


KenFeed™ 2X Series

Primary Application

KenFeed 2X is a double-sided trigon with six cutting edges engineered to provide superior metal removal and productivity through high feed rates in roughing operations. Smaller depths of cut at extremely high feed rates result in lower cutting forces, reducing vibrations and increasing process reliability.

Features and Benefits



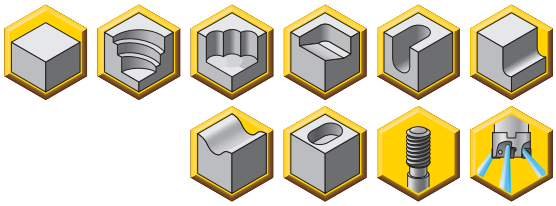
- Six cutting edges per insert. Double-sided solution with unique design.
- Two different topography styles cover any type of material, component, and application.
- KenFeed 2X inserts are specially suitable for long, deep applications, up to 10 x L/D ratio.

9mm IC Insert WOEJ094....
Up to 0.059" Ap max.
Diameter 1.000–3.000"

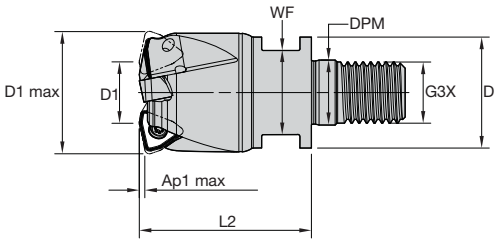
The ultimate and innovative concept for applying the latest high-feed milling strategies.

Strong design with a thick insert provides outstanding reliability.

Screw-on, end mill, and shell mill cutters with internal coolant.



Platform designed for pocketing, ramping, and helical interpolations.



Just two topographies to cover all applications with easy selection.

Double-sided insert with six cutting edges for better cost-per-edge position with full usage.

No need for additional clamping device. Screw provides easy handling.

- Dramatically improves MRR using the latest milling strategies.
- Engineered to run up to 0,1 IPT.
- Ideal for pocketing, ramping, and helical interpolations. Z-plunge capabilities.
- First choice for deep cavities or from 3 x D.

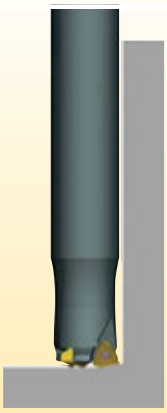
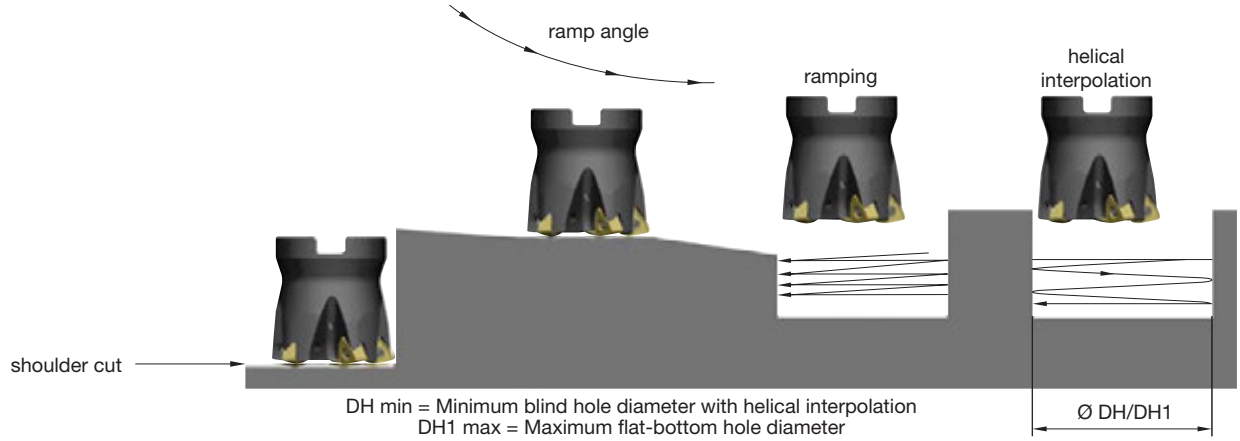
General Programming Information for Applying KenFeed 2X • IC 09



Rt	Wt	t
.110	.312	.045

Small Ap1 values and higher feed rates generate lower cutting forces versus traditional milling strategies.



For CAM programming, the loads can be programmed as a toroidal tool type by using the Rt value as the insert radius.

Recommended when long overhang is necessary due to lower radial forces. Maximum L/D ratio of 10 x D.

Maximum Linear Ramping and Helical Interpolation from Solid • Inch

Rodeka™ Inserts

The New Round Insert Generation

Primary Application

Kennametal introduces a revolutionary double-sided round milling insert capable of running in multiple types of milling operations and workpiece materials. The Rodeka series provides the latest double-sided insert technology to boost your productivity with the most efficient cost per edge.

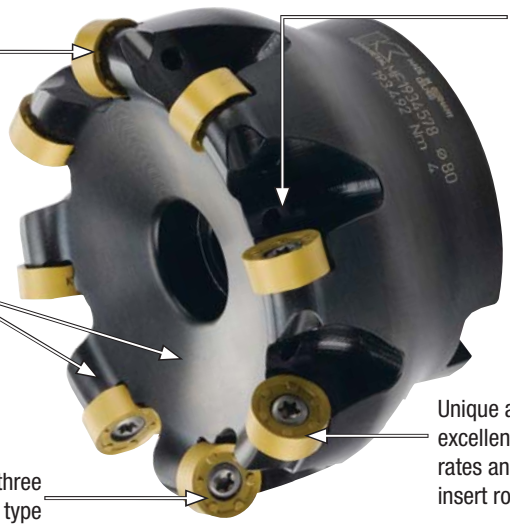
Features and Benefits

Rodeka Double-Sided Round Inserts

- Three insert sizes: 10, 12, and 16mm.
- Innovative, cutting-edge design increases tool life and reduces cutting forces.
- Rodeka 12X series is a tailor-made solution for turbine blade machining.

Rodeka 10
10mm IC insert
8 cutting edges

Rodeka 12X
12mm IC insert
8 cutting edges

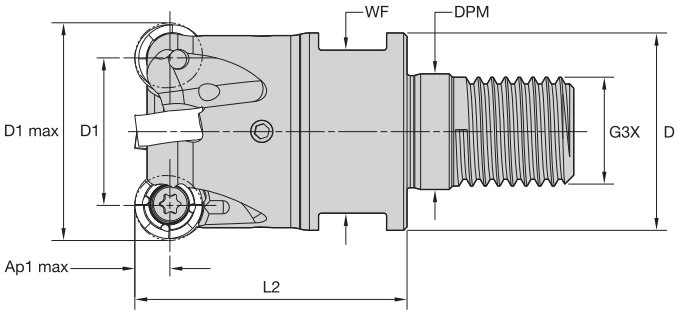


Rodeka 12
12mm IC insert
12 cutting edges

Rodeka 16
16mm IC insert
12 cutting edges

Double-sided insert with up to 12 cutting edges for a more productive cutting process.

Screw-on, end mill, and shell mill cutters with internal coolant.



Higher clearance in bodies to permit pocketing, profiling, and 5-axis machining.

Unique anti-rotation feature for excellent stability with higher feed rates and cutting forces. User-friendly insert rotation.

Three different insert sizes and three topography styles per size cover any type of material, component, and application.

- Double-sided round insert with eight indexable positions.
- Anti-rotation features enable higher cutting data and extra stability.
- Pocketing and profiling capabilities.

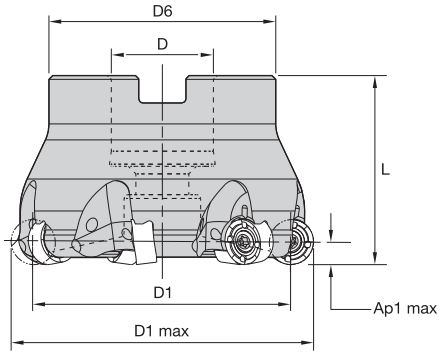
Rodeka 12X Turbine Blade Version



Revolutionary double-sided round insert engineered for turbine blade machining. Special geometries, insert styles, and dedicated cutter bodies have been developed to serve this demanding application.

- Double-sided round inserts with eight indexable positions.
- Anti-rotation features enable higher cutting data and extra stability.
- Engineered for turbine blade machining.

The Next Generation Spindle Interface for Heavy-Duty Machining!

KM4X™

KM4X is designed to take on your most aggressive machining jobs. This next generation KM™ spindle interface should be your first choice for heavy-duty machining applications. It's especially suited for large structural components, like titanium aerospace components.

We engineered these rotating and static tool adapters to handle 3x more bending capacity than similar competitive models.

What does this mean for you?

- Enables full use of machine and cutting tools for the highest productivity.
- Higher metal removal rates.
- Can retrofit to existing machines to boost throughput without buying new equipment.
- Ideal for aerospace and transportation industry machining jobs.

Visit **kennametal.com** or contact your local Authorized Kennametal Distributor.

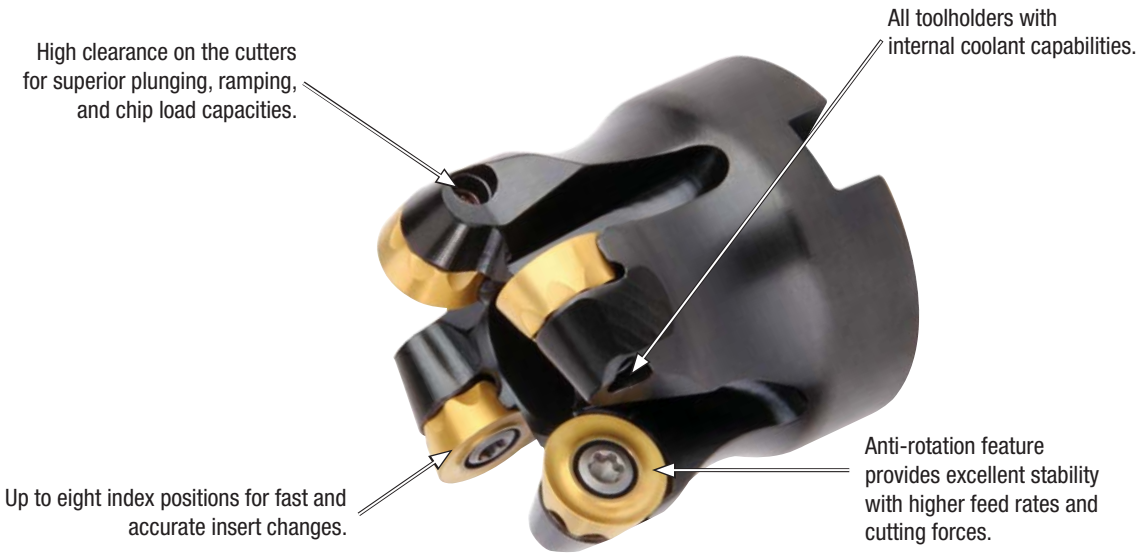
KENNAMETAL®

kennametal.com

KSRM™ Series

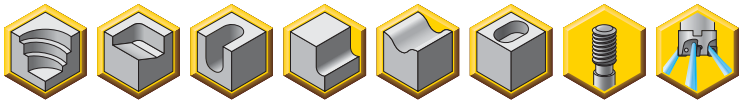
Multipurpose Milling Cutters • 12mm, 1/2", 16mm, 3/4", and 1" ICs

Primary Application

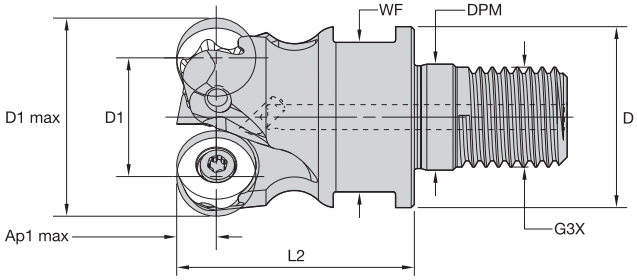


Specially developed for machining titanium and stainless steel. KSRM platform enables you to pocket, profile, ramp, and plunge with consistent performance and outstanding metal removal rates with the lowest cutting forces.

Features and Benefits



- Up to eight cutting edges per insert.
- Anti-rotation feature achieves excellent stability.
- Engineered to provide longer tool life in titanium and stainless steel.
- Roughing and semi-finishing operations with lower cutting forces.



High clearance on the cutters for superior plunging, ramping, and chip load capacities.
All toolholders with internal coolant capabilities.
Up to eight index positions for fast and accurate insert changes.
Anti-rotation feature provides excellent stability with higher feed rates and cutting forces.

- Engineered for titanium and stainless steel machining.
- Anti-rotation components feature eight indexable positions.
- Pocketing, ramping, plunging, and helical interpolation capabilities.

- Engineered for titanium and stainless steel machining.
- Anti-rotation components feature eight indexable positions.
- Pocketing, ramping, plunging, and helical interpolation capabilities.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Engineered for roughing with large depths of cut through positive geometry inserts.
- Anti-rotation feature with six indexable positions.
- Excellent for long overhangs.
- High coolant pressure capabilities.

Mobile App

The Kennametal mobile app makes it easy to access product information, calculators, and much more from iPhone® and Android™ devices.

FEATURES

Scan a Kennametal tool package barcode or search a product catalog number to access complete product information.

Product information includes tool image, dimensions, grades, and product highlights.

View product availability at global locations.

Get speed and feed information in inch and metric values for all metalcutting products.

View tech tips for helpful solutions to common machining questions.

Contact Customer Support directly from the app.

MACHINING CALCULATORS

View data for milling and drilling applications.

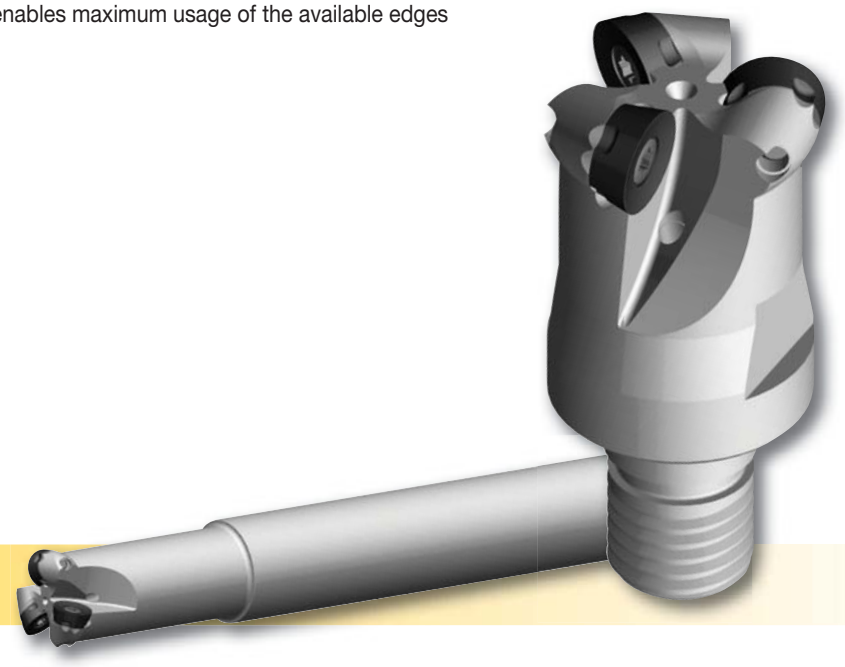
Inch and metric values calculated.

ORDERING

Login using your Konnect credentials to complete a purchase.

WHERE TO FIND IT

Download the free app today from iTunes® or the Google Play™ store.



ANDROID APP ON Google play

Available on the App Store

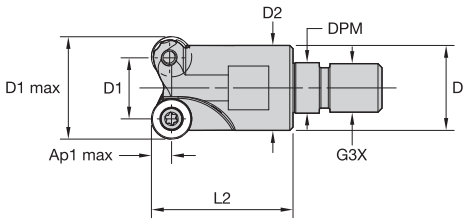
7713VR Series

Round Insert Milling Cutter with Indexation

The 7713VR is our newest round insert cutter series. Designed with a new silver-satin surface treatment that reduces body degradation during high-performance applications and enhances body tool life. This cutter series has an anti-rotation design that ensures a precise number of indexes per insert. This enables maximum usage of the available edges for roughing applications.

Features and Benefits

This unique patented pocket system prevents the inserts from rotating in the pocket during heavy-feed machining and unstable conditions. The 7713VR cutter is excellent for roughing and semi-finishing of all materials, especially stainless steel and high-temperature alloys, as well as for steel, tool steel, and aluminum alloys.



7713VR10:
Maximum ap = .197"
Diameter Range = 1–2.50"

7713VR12:
Maximum ap = .236"
Diameter Range = 1–3"

- Turbine blade machining and copy/contour milling applications.
- Patented locking system prevents insert rotation during heavy machining.
- Positive flute design for excellent chip evacuation.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Turbine blade machining and copy/contour milling applications.
- Patented locking system prevents insert rotation during heavy machining.
- Positive flute design for excellent chip evacuation.

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

7713VR Technical Information

Working Diameter:

Formula to evaluate the correct working diameter based on axial depth of cut (a_p).

$$D_W = D_2 + 2 \times \sqrt{r^2 - (r - a_p)^2}$$

where:

D_W = Working diameter
D_2 = Diameter of cutter insert center to center
r = Insert radius
a_p = Axial depth of cut

where:

f_z = Feed per tooth
hm = Average chip thickness
r = Insert radius
a_e = Radial depth of cut
a_p = Axial depth of cut

Formula to find programmed feed rate based on radial engagement and axial depth of cut.

$$f_z = \frac{h_m}{\frac{\sqrt{r^2-(r-a_e)^2}}{r} \times \frac{\sqrt{r^2-(r-a_p)^2}}{r}}$$

Formula to calculate the average chip thickness h_m in relation with radial engagement and depth of cut.

$$h_m = f_z \times \frac{\sqrt{r^2-(r-a_e)^2}}{r} \times \frac{\sqrt{r^2-(r-a_p)^2}}{r}$$

Simplified formulas to evaluate h_m and f_z based on radial engagement or depth of cut.

Calculation of the average chip thickness in relation with the D.O.C. (Axial)

Formula: Program Feed Rate (f_z)

$$f_z = h_m \times \sqrt{\frac{d}{a_p}}$$

h_m = Average chip thickness
a_p = Depth of cut
f_z = Feed per tooth
d = Insert diameter

Formula: Average Chip Thickness (h_m)

$$h_m = f_z \times \sqrt{\frac{a_e}{d}}$$

Calculation of the average chip thickness in relation with the a_e (Radial Engagement) if a_e is less than 50% of diameter

Formula: Program Feed Rate (f_z)

$$f_z = h_m \times \sqrt{\frac{d}{a_e}}$$

h_m = Average chip thickness
a_e = Radial engagement
f_z = Feed per tooth
d = Cutter diameter

Formula: Average Chip Thickness (h_m)

$$h_m = f_z \times \sqrt{\frac{d}{a_p}}$$

Carbide Recycling

Help preserve and protect our planet!

It's easy for your company to be environmentally conscious with the Kennametal Carbide Recycling Program.

By sending us your used carbide tools, you help preserve and protect the environment and ensure that these products are recycled responsibly. Kennametal accepts any coated or non-coated carbide items, including inserts, drills, reamers, and taps.

By using the Kennametal Carbide Recycling Program, you will receive:

- A partner who cares about a sustainable environment.
- Easy-to-use web portal to value your used carbide.
- Access to our popular Green Box™ options for carbide collection.
- Systematic and efficient disposal of carbide materials.
- Improved profitability.

Program is not currently available in all geographical areas.
For more information, please visit **kennametal.com/carbiderecycling**.

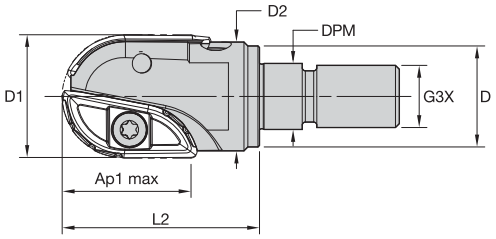
Contour Milling



Ball Nose Contour Milling Cutter

- The 5505VX ball nose cutters have a reinforced design feature, which delivers a high volume of chip removal.
- The chipbreaker geometry provides excellent chip control and evacuation during machining and prevents edge build-up.
- 5505VX roughing ball nose cutters are ideal for roughing and semi-finishing profiles and complex contours.
- One grade and one geometry are qualified to machine steel, alloyed steel, stainless steel, high-temperature alloys, and cast iron.

- Rough to semi-finish profiling and contour milling.
- Helical insert design for increased speeds and feeds.
- One insert geometry covers most materials for optimized inventory.

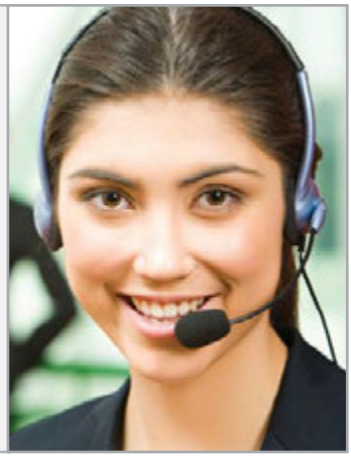
Service and Support

Customer Application Support (CAS)



Get Fast and Reliable Answers to Your Toughest Metalcutting Problems

Our Customer Application Support (CAS) Team is the metalworking industry's leading help desk resource for tooling application solutions and problem resolution.

Easy Access to Proven Metalworking Expertise!

Kennametal Customer Application Engineers assist customers and engineering groups throughout the world with expert tool selection and application recommendations for the entire range of Kennametal tooling.

SERVICE LEVEL EXCELLENCE	Fast telephone response. Quick technical solutions. Efficient case management.
SERVICES	Operating parameters. Process optimization. Hardware support. Tooling selection. Troubleshooting.
BEST-IN-CLASS SUPPORT TOOLS AND TECHNOLOGY	Materials database. Application calculators. Tooling performance experts.

Indexable Copy Insert Platform

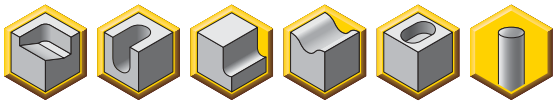
Primary Application

Ball nose and toroidal styles for roughing and finishing operations. Engineered with the ultimate technologies and supported with a wide range of diameters and insert styles to provide exceptional performance and productivity. The new high-feed insert style provides the highest metal removal rates for roughing applications.

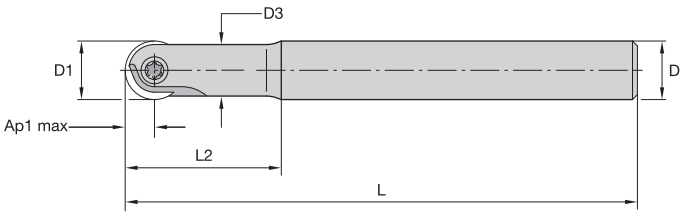
Features and Benefits

Longer Tool Life and Improved Geometries

- Longer tool life for finishing operations, up to 63 HRC.
- High-accuracy inserts and holders: overall runout .0004".
- Improved geometries for roughing and finishing operations.
- Smaller diameters from .25" to replace SCEM, setting a more productive machining process.



Superior Productivity



- Achieve better surface quality with the new helical geometry.
- New ultra-grain grade for outstanding tool life.
- Diameters .250" and .312" are a natural replacement for SEM tools.
- Better cost per edge.

Usability and Flexibility

- Wide diameter range enables use in a wide range of machining conditions.
- Many workpiece materials are possible — from hardened steel to aluminum.
- Large holder style offering: screw-on, cylindrical, and tapered steel and carbide holders.

- Cutting diameter ranges from .375–1.250".
- Ball nose finishers for 3D milling applications.
- Suitable for roughing and fi nishing operations.
- High precision and runout accuracy.
- Can be used with heat shrink technology, h6 shank tolerance.

- Ball nose finishers for 3D milling applications.
- Suitable for roughing and finishing operations.
- High precision and runout accuracy.
- Can be used with heat shrink technology, h6 shank tolerance.

Necked End Mills • Cylindrical Shank • Carbide

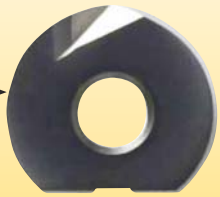
Insert Style

HC Geometry:

PSTS geometry with chipbreaker for roughing. Semi-finishing and rest material of steel, cast steel, and high-temperature alloys.

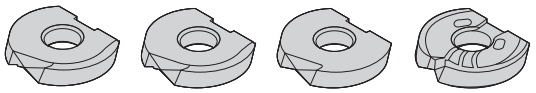
roughing, rest material

GP Geometry:

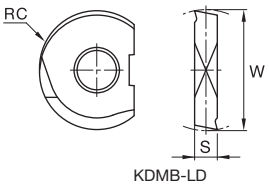


High-precision insert with helical geometry for semi-finishing and finishing of steel up to 63 HRC, cast steel, and high-temperature alloys.

semi-finishing, finishing



GN Geometry:



Geometry with extremely solid cutting edge for roughing cast steel, high-temperature alloys, and hardened steel up to 60 HRC.

finishing

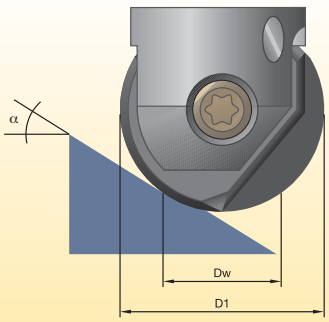
NOTE: Working diameter (Dw) or effective diameter has to be considered when calculating appropriate RPMs.

Calculating Working Diameter and Resulting Surface Speed

Case 1:



It is important to consider the effective diameter (Dw) when using light depths of cut in order to properly calculate RPM values. Use the following formula when machining flat surfaces or inclinations of 10° or less to find the Dw value. Then, use this for RPM calculations, as opposed to using the overall insert diameter (D1).

$$Dw = \sqrt{D1_2\text{-}(D1\text{-}2Ap1)_2}$$

Case 2:

When machining inclinations between 11° and 55° , further modification of vc is required. Apply factor “k” from the given formula to calculate the correct vc (vceff). This corrected value is then used to calculate the proper RPM for the tool.

$$k = \frac{1}{\sin [\alpha + \arccos (1\text{-}(2\ (Ap1/D1)))]}$$

$$vceff = vc \times k$$

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X32–X37 for recommended starting speeds.

- Cutting diameter ranges from .500–1.000".
- High precision and runout accuracy.
- Can be used with the heat shrink technology, h6 shank tolerance.
- Suitable for roughing and finishing operations.
- Works with toroidal and high-feed inserts.

Please see pages X22–X37 for recommended starting speeds.

Application Advice for KDMT-HF Insert Style

For CAM programming, the tools can be programmed as a toroidal tool type requiring the diameter and the RT values only.

insert type	inch			
	Ap max	diameter	RT	max fz
KDMT0500SRHF	0.025	0.500	0.045	0.050
KDMT0625SRHF	0.030	0.625	0.050	0.050
KDMT0750SRHF	0.040	0.750	0.080	0.050

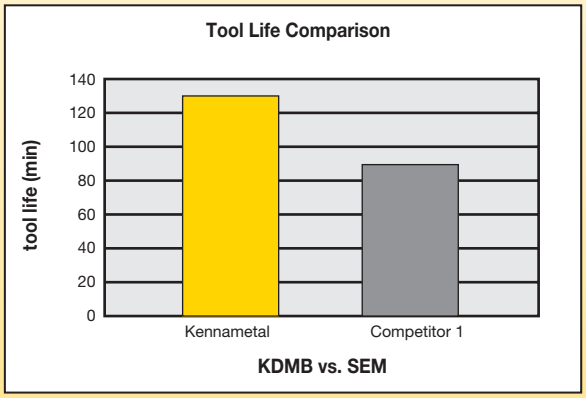
Data for Face Milling, Pocketing, and Profiling Operations

Starting Values

tool diameter	Ø.500"	Ø.625"	Ø.750"
Ap max (mm)	0.024	0.031	0.039
fz recommended for 45 HRC (approximately)	0.020	0.022	0.026
fz recommended for 55 HRC (approximately)	0.016	0.020	0.022
fz recommended for general purpose	0.026	0.028	0.031

NOTE: Use two effective teeth for feed calculations.
For materials above 45 HRC, we recommend to adjust the Ae max to 55% of cutting diameter.
Steel shanks for roughing operations are recommended.

Proven Solutions:



KDMB™ Indexable Milling Cutter vs. Solid Carbide End Mills

1.

Workpiece:
Forging die
Material:
X38 CrMoV 5 3 (1.2367)
Size:
154mm x 115mm x 80mm
Machine:
Vertical milling machine center

Kennametal
Tool: KDMB06R100A06HN
Insert: KDMB06M0ERGN KC505M
Competitor 1
Solid Carbide End Mill
Ø 6 R3

Cutting data:
vc = 825 SFM (250 m/min)
Ap = .099" (0,28mm)
ae = .052" (1,32mm)
fz = .0052" (0,131mm)

Superior Productivity:
Higher tool life and cost per piece

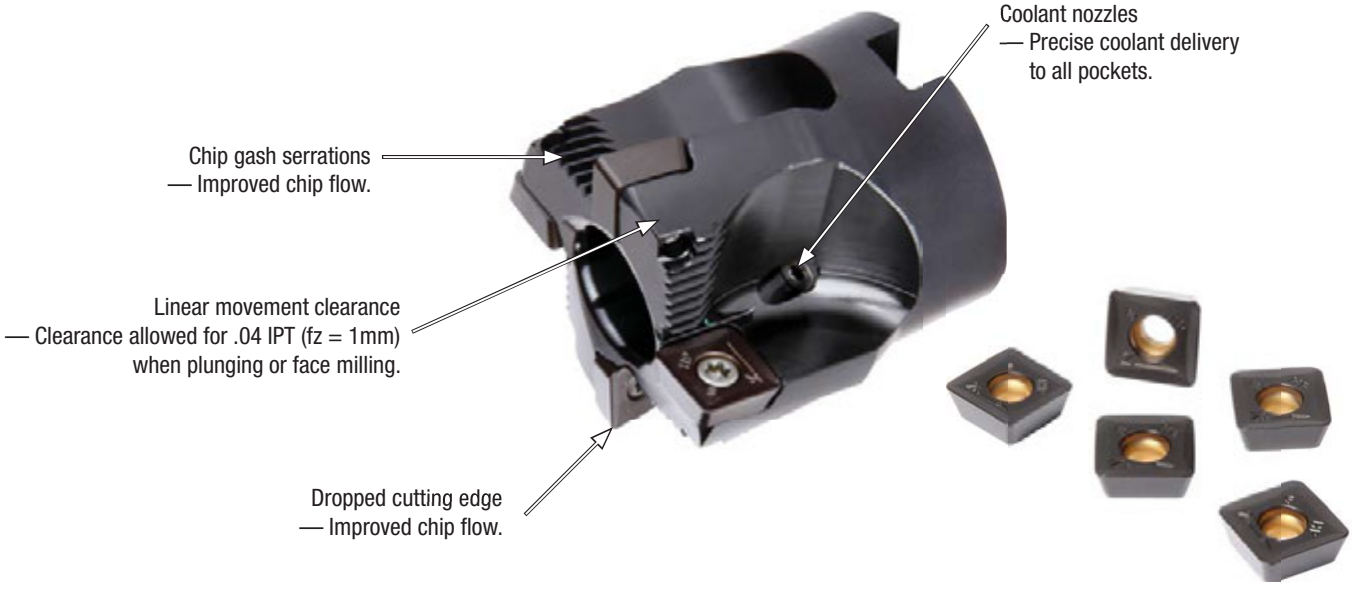
2.

Workpiece:
Pressing die component
Material:
1.2479 (D2)
Size:
410mm x 320mm x 210mm
Machine:
Vertical milling machine

Kennametal
Tool: KDMB06R100A06HN
Insert: KDMB06M0ERGP KC515M
Competitor 1
Solid Carbide End Mill
Ø 6 R3

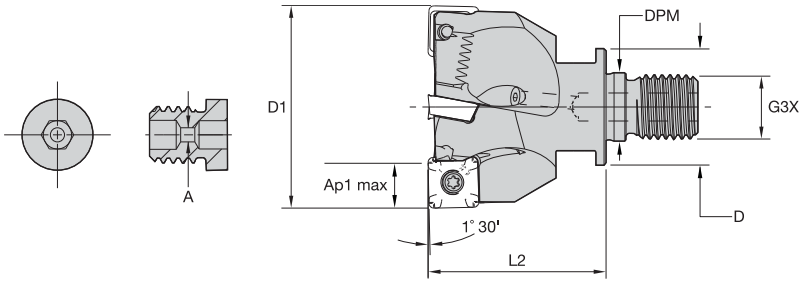
Cost Performance Ratio:
Costs for diameter 6mm
MMC:
solid carbide end mill +
2 x regrinding
Reference: 100%
KMT:
3 x inserts +
3 x toolholder share:
Cost savings: 31.15%

Z-Axis Plunge Mill



Primary Application

Specifically engineered to eliminate vibration and improve metal removal rates in roughing applications. Ideally suited for rough slotting applications in aerospace, general engineering, die and mold, and power generation.



Features and Benefits

Platform Features

- Nine coolant nozzle sizes enable customized flow by machine tool.
- Unique design is unmatched for chip evacuation.
- Improved performance at a reduced cost per cutting edge.
- Positive geometry lowers cutting force and reduces power requirements, enabling higher feed rates.
- Improved chip control when slotting.
- Fast and easy insert indexing.

- Most stable cutting due to force directions.
- Excellent for long-reach applications.
- Extended tool life.
- Suitable for a wide variety of workpiece materials.
- Up to .433" stepover.
- Unique coolant delivery.
- Chip control when slotting.

Coolant Nozzle Key

order number	catalog number	drive size
1993552	**THW2M**	2 MM

NOTE: Check the spare parts table for the coolant hole size that is incorporated in the cutters.
If you need an alternative, there are eight other variants to choose from to increase or decrease the pressure.
Example: MS2191C12 is a .047" (1,20mm) hole. All coolant nozzles are interchangeable with the original that is supplied with the cutter, which gives flexibility with coolant flow.

- Most stable cutting due to force directions.
- Excellent for long reach applications.
- Extended tool life.
- Suitable for a wide variety of workpiece materials.
- Up to .433" stepover.
- Unique coolant delivery.
- Chip control when slotting.

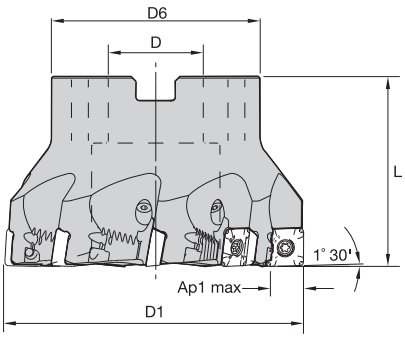
Coolant Nozzle Key



order number	catalog number	drive size
1993552	**THW2M**	2 MM

NOTE: Check the spare parts table for the coolant hole size that is incorporated in the cutters.
If you need an alternative, there are eight other variants to choose from to increase or decrease the pressure.
Example: MS2191C12 is a .047" (1,20mm) hole. All coolant nozzles are interchangeable with the original that is supplied with the cutter, which gives flexibility with coolant flow.

- Easy cutting.
- Four cutting edges.
- Consumes less power.
- Suitable for a wide variety of workpiece materials.
- Up to .433" stepover.
- Fast and easy insert indexing.
- Unique coolant delivery.
- Chip control when slotting.

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Z-Axis

Best Machining Practices

When finishing a workpiece, you sometimes have to use a Z-axis solution versus a conventional end mill solution to get the best results.

When the length-to-diameter ratio protrudes farther than 3:1, you will need to use a Z-axis solution. This is when the end mill starts to vibrate and the surface finish and noise are unacceptable.

When vibration occurs, the feed rates are compromised, which normally slows down the production of the workpiece.

Programming

At this point, there is very little software for this type of application on the market. We suggest that a simple macro is created for this type of application, which can be recalled and the “X” and “Y” movement changed.

The process can be repeated, so the cutter can be removed from the workpiece in the rapid (G00) movement. Tool life will be improved by not allowing the insert to rub on the retract path.

Slotting

There are several differing ways to machine a slot in a component using the Z-axis cutter solution.

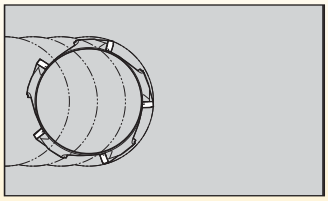

Figure 1

This shows the typical way of machining a slot. The movements are feeding down and straight back up (Z+) in the same axis and will have a negative impact on the insert radii (cutting edge) that could lead to premature failure of the nose radii. When looking at the component, it will show the rapid travel in the Z+ direction. This will highlight the spiral of the insert/cutter operating at a high feed. It looks similar to an oil groove spiraling upwards.

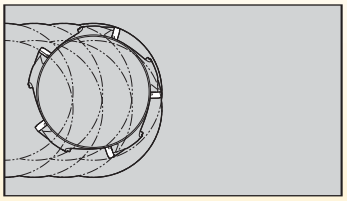

Figure 2

Using a cutter that is smaller than the slot width allows the insert/cutter to be removed from the material when (G00) rapid motion is retracting from the component. Because this type of cutter can be used across various types of machines, assume a 2.00" (50mm) diameter cutter is being used to machine a slot of 2.50" (63mm) wide on a vertical 3-axis machine.

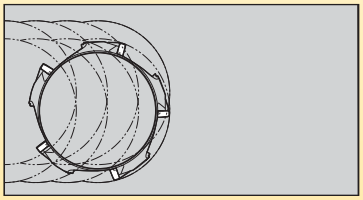

Figure 3

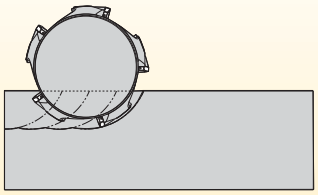
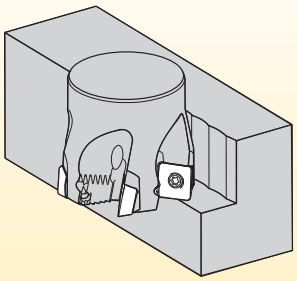
Align the cutter with the center of the slot on the component and define the stepover that’s required. Move the Y-axis into a position for the first cut, take the first pass to a depth in the Z-axis, and when it reaches the bottom of the slot, program a 2-axis move to retract the cutting edge for the workpiece.

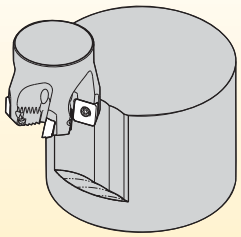
The 2-axis move will move the Z-axis in a positive direction at 45° (.010") away from the component, and the Y-axis will move away from the workpiece by the same amount at the same angle. Now the cutter can be retracted from the component, and the insert will not rub on the retract move.



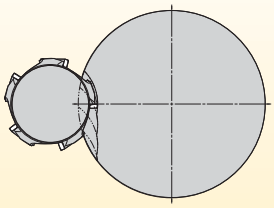
Move the cutter to the left of the slot to define the new position and make the cut. When reaching the base, a 3-axis move will need to be made. Again, the Z-axis will be in a positive direction at 45° (.010"), and the corresponding Y-axis will move away the same respective amount from the wall.



The insert/cutter has now moved away from the workpiece, and the rapid Z+ can take place. Repeat the process on the other side of the slot, remembering the X-axis move needs to be moving the other way.



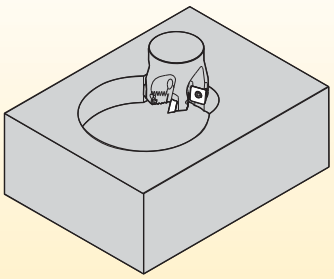
NOTE: When starting the process, it’s better to start at the center of the slot. After the slot has been defined, you no longer need to put the cutter on the center path. Passes from both sides create the slot width and enable clearance for the subsequent moves, so the insert/cutter can be moved away from the side walls of the material.



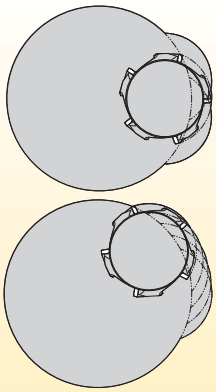
(continued)

Z-Axis *(continued)*

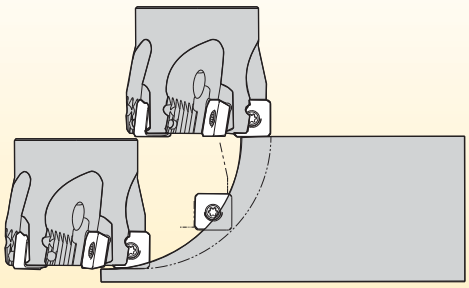
Linear Plunge Milling



Entering the cutter along a parallel axis, the radial width of cut needs to be defined because the cutter might need to move away from the workpiece material.



If the radial width of cut takes more than 60% of the cutter diameter, it is more difficult to remove the insert/cutter because the machine program wants to move the cutter upwards to (G00) Z+. When taking more than 60% of the cutter diameter, the material is enveloping the cutter and is difficult to remove because a cusp has been created.



It is suggested to make the radial width of cut 50% of the cutter diameter to allow the insert/cutter to be removed without any problems.

External Profiling

This artwork represents the typical application for this type of process. Move into the cut and follow the external profile of the workpiece. When moving the cutter back to the start position, it's always advisable to move the insert from contacting the workpiece. This should be done with a 2- or 3-axis move (use .010") at 0,25mm. All axes moving in a Z+ direction will stop the rubbing in the retract move.

Internal Profiling

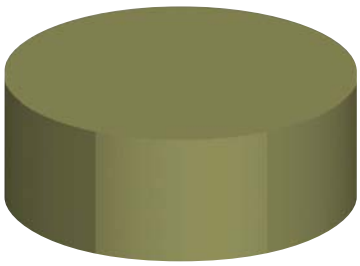
When taking the first pass of a depth, there is also a need to move the insert/cutter away from the material on the retract motion. Each of the passes that follow should adopt the same method on the retract move.

Follow the cutter path until the component has been finished.

Machining Around a Radii

This artwork shows the cutter taking a larger radial width of cut. When moving down in the Z-axis, the insert could start to take a larger radial width of cut. Typical application could be the manufacture of a turbine blade from a rectangular piece of material. Always remember that it's advisable to move the insert/cutter away from the material on the retract motion.

KCRA



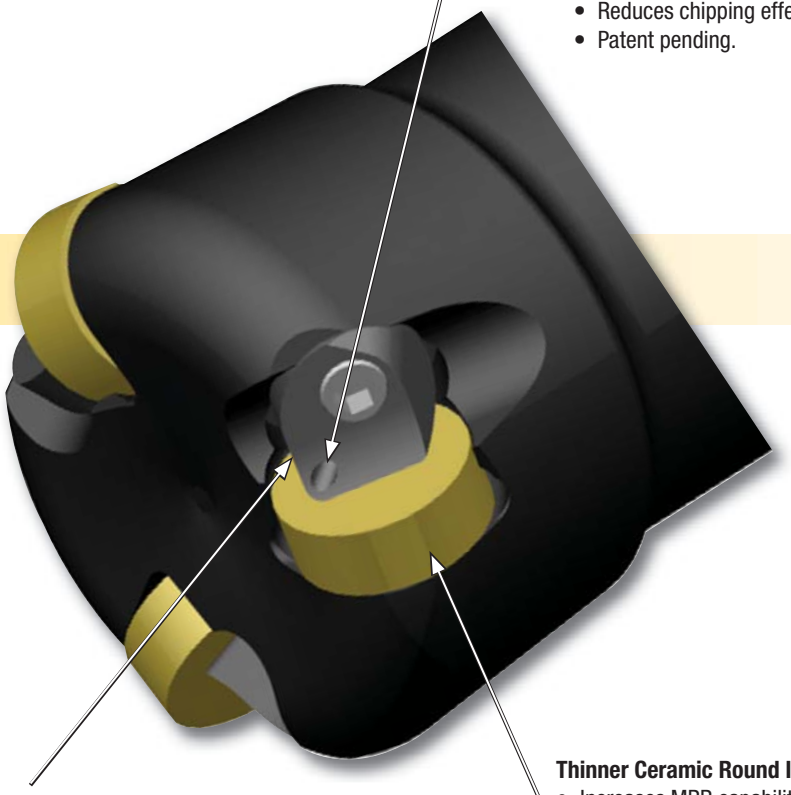
Double-Sided Ceramic Round Insert

KCRA is our newest (patent pending) indexable milling ceramic round platform specifically engineered to maximize productivity while machining high-temperature alloys. Featuring double-sided inserts with increased tooth density, KCRA provides the highest Metal Removal Rate (MRR) with the most effective machining.

Kennametal ceramics dramatically increase your productivity when machining Ni- and Co-based alloys.

Features and Benefits

- First choice for face and shoulder milling of high-temperature alloys.
- Higher metal removal rate due to fine-pitch cutters.
- Secure clamping system improves process stability and reliability.
- Effective air coolant feature. Better chip flow and increased insert tool life.

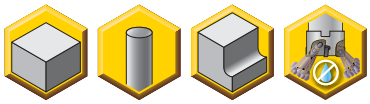


Flat-top geometry for roughing applications in Ni- and Co-based alloys.

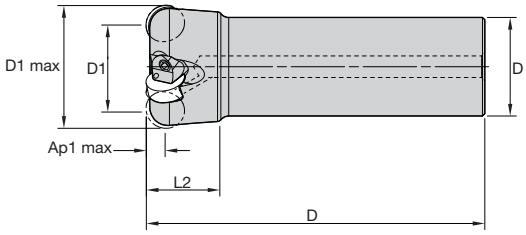
-EGN
Lower cutting forces.

-TGN
Strongest cutting edge.

*Alternative for unstable situations.



Unique Air Coolant Feature
- Improves chip flow.
- Reduces chipping effect on cutting edges.
- Patent pending.



Secure Clamping System
- Improves stability.
- Increases process reliability.
- Facilitates insert change.

Thinner Ceramic Round Inserts
- Increases MRR capabilities.
- Reduces cutting forces.
- Improves cost per edge.

- First choice for face and shoulder milling high-temperature alloys.
- Higher material removal rate due to fine pitch cutters.
- Secure clamping system, improving process stability and reliability.
- Effective air coolant feature. Better chip flow and increased insert tool life.

Please see pages X22–X37 for recommended starting speeds.

Insert Assembly Guide

Safety Notes					
					
Read all instructions carefully	Wear eye protection	Inspect and tighten fasteners regularly	Warning: Cutting hazard	Warning: Hot surfaces	Do not exceed maximum RPM

Assembly Instructions	
1 Assemble STCM-25 screw to KW1008 wedge, 1 to 1 1/2 turns.	**2** Wedge/screw assembly.
	
3 Install wedge/screw assembly into cutter body, but maintain assembly gap for installing insert.	**4** Slide insert, RNGN12... into pocket and torque wedge/insert assembly to 3,5 Nm (31 in/lbs). Repeat for each pocket.

FIND THE LATEST PRODUCT INFORMATION

Whether your operation is turning, milling, or holemaking, Kennametal brands are the high-performance tooling you need. We offer standard and custom solutions for a wide range of applications.

Find information about our most current campaigns and catalogs.

Register on Konnect for the full functionality of the Kennametal online ordering website.

CONTACT US

Our customers are important to us. We want to provide you the best customer service in the industry. If you have a comment or question, please send it to us. We strive to respond to all inquiries within 24 hours.

FIND A LOCAL AUTHORIZED DISTRIBUTOR IN YOUR AREA

Kennametal offers world-class products and services globally. Our distributors know us, and more importantly, they know you. They know better than anyone in the industry how to put the global power of Kennametal to work for you — in your industry, in your region, and for your business.

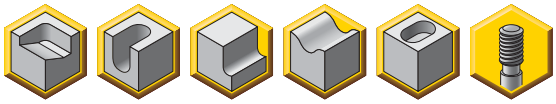
KIPR™

Ceramic Milling Cutters

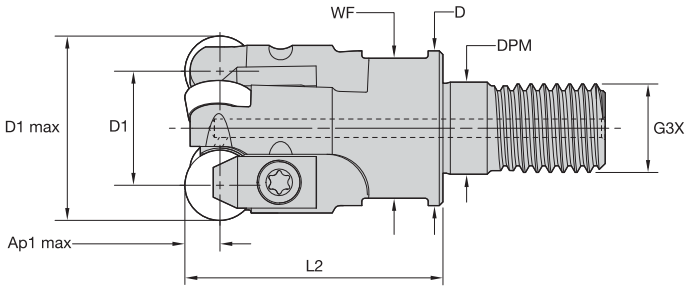
Primary Application

The Kennametal ceramic milling platform has been specifically engineered to machine high-temperature alloys, PH series, stainless steel, and hardened materials. With excellent productivity through the massive reduction of machining time, Kennametal ceramics can run more than 10 times faster than comparable carbide grades.

Features and Benefits



Unbeatable Productivity



- Engineering to provide outstanding metal removal rates and productivity in nickel-based and/or cobalt-based alloys, stellites, stainless steel, and PH series through HSM.
- High axial and radial runout accuracy.
- Improved insert clearance and thickness tolerance to increase overall performance.
- New clamping system design provides higher spare part tool life and reliability and higher RPM.

Usability and Offering

- Three grades and three insert sizes available to cover a wide range of applications.
- Wide diameter range with end mills and Screw-On cutters from diameter 0.625".
- High clearance on the cutters for superior ramping capacities.
- Through-coolant option in all the cutters. Only for air use.

- For machining high-temp alloys, PH stainless, stainless steels, and hardened materials.
- Excellent productivity through massive reduction of machining time.
- Face milling, pocketing, and ramping capabilities.
- Through-body coolant delivery for internal air supply only.

NOTE: A — Use these tools with the appropriate equipment/machines. Machines have to be covered for safety reasons: Hot flowing chips and loud noise are involved, which is common during the milling process.
B — Use only air flow as coolant method.
C — Higher RPMs are involved; use balanced toolholder for higher tool life and safer operation.
D — Consider increasing the fz in hard machining when smaller Ap are applied.

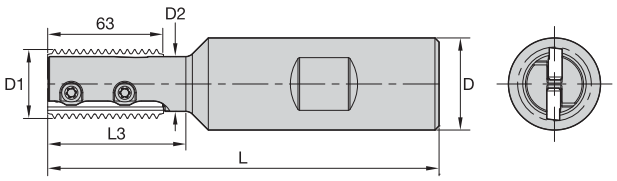
TM Series

The latest Kennametal indexable thread milling tools deliver longer tool life and higher productivity while offering a comprehensive range of thread styles and sizes:

- TM24 Series — Small-bore threading applications with one cutting edge per insert.
- TM25 Series — Standard threading applications with two cutting edges per insert.
- TM40 Series — Long-thread threading applications with two cutting edges per insert.
- TM41 Series — Large-pitch threading applications with two cutting edges per insert.

Features and Benefits

Cutter Body Offering



- Number of flutes:
  - TM24: 1–2 per body
  - TM25: 2–8 per body
  - TM40: 3–8 per body
  - TM41: 2–6 per body
- Short and long toolholders for multiple applications.
- Cutters available in parallel Weldon® and conical Weldon holders.
- Effective through coolant for each flute.
- Better chip evacuation.

Insert Offering

- Robust design.
- Inserts for ISO, UN, W, NPT, NPTF, and BSPT thread profiles.
- Pitch:
  - TM24: 32–10 TPI (0,50–2,50mm)
  - TM25: 20–8 TPI (1,00–3,00mm)
  - TM40: 32–10 TPI (1,00–3,00mm)
  - TM41: 8–4 TPI (3,00–6,00mm)
- Grades for most workpiece materials.
- Easy clamping systems.
- Fast indexing of inserts.

- .530–.630" cutting diameter range.
- For internal and external threading on most types of workpiece materials.
- One tool is used for both right- and left-hand threads.
- All cutters have through-coolant capability.
- Utilizes inserts with various profiles and pitches.

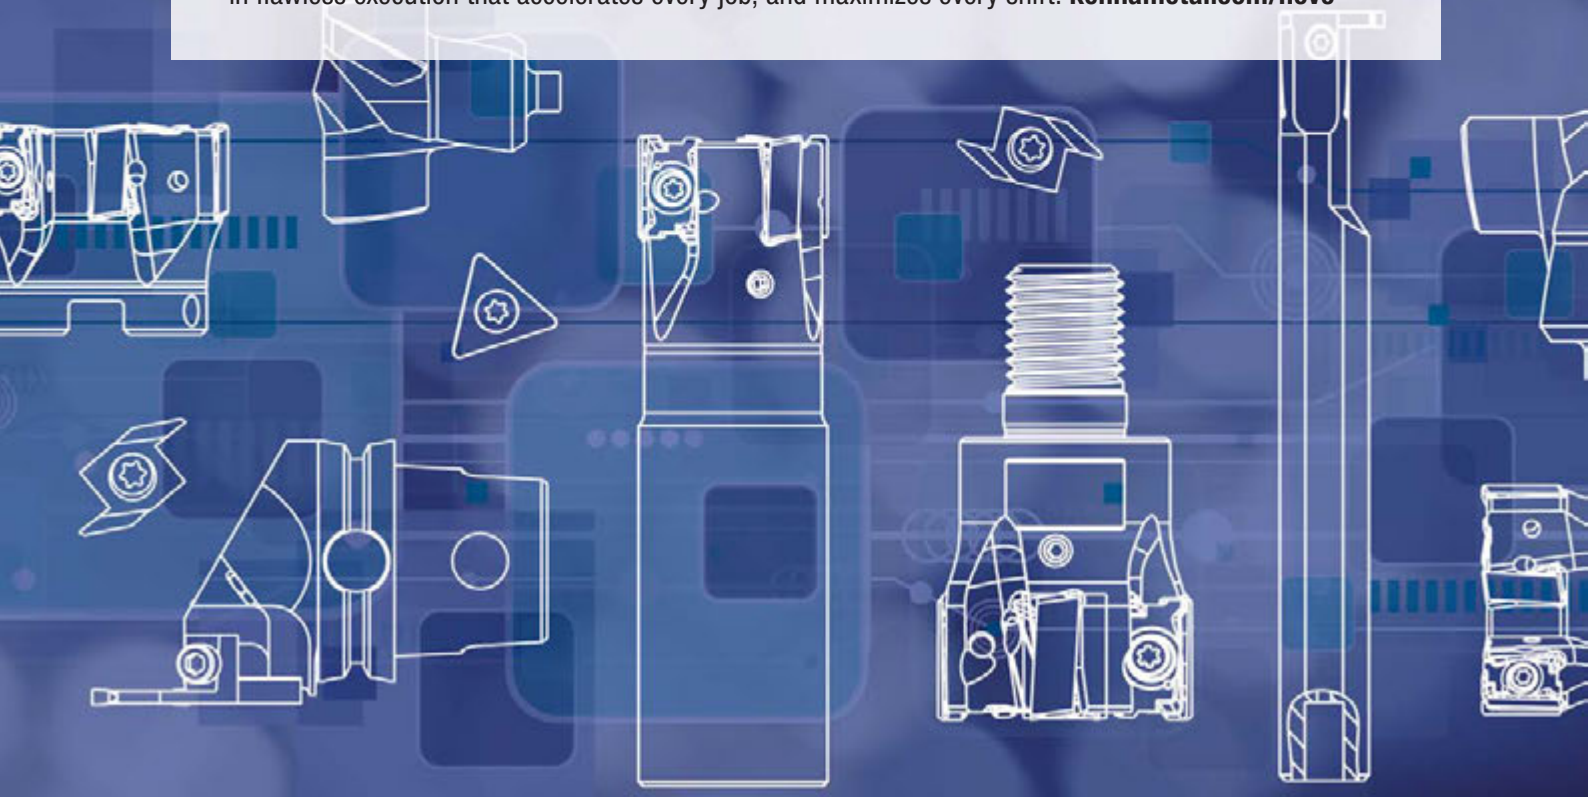
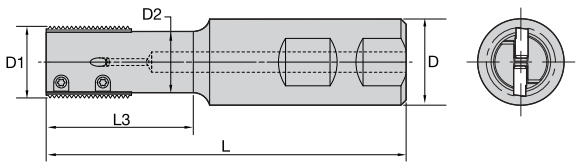
TM-CNC Generator for CNC Programming on our website under: **http://www.kennametal.com/en/resources/software.html**.

NOVO KNOWS CAD/CAM



With the addition of NOVO™ applications to your team, your CAD/CAM capabilities become much more accurate, streamlined, and productive.

Before NOVO: The programmer would be in their CAD/CAM software, programming a part. Using the outdated method of finding a tool in a catalog, and then manually inputting the tooling information from the catalog into the CAD/CAM software.



The concern is that assumptions are made, and only partial tooling information is entered.

With NOVO: The powerful digital intelligence of NOVO applications not only help the programmer find the right tool for the metalcutting job, but also automatically integrates all the tooling data into a complete CAD/CAM solution. The integration of all the tooling data increases the viability of the part being programmed, and is delivered quickly — saving you time.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximizes every shift. **kennametal.com/novo**

- .670–2.047" cutting diameter range.
- For internal and external threading on most types of workpiece materials.
- One tool is used for both right- and left-hand threads.
- All cutters have through-coolant capability.
- Utilizes inserts with various profiles and pitches.

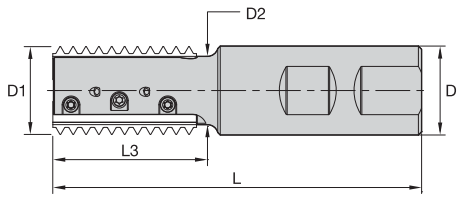
Carbide Recycling

Help preserve and protect our planet!

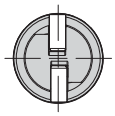
It's easy for your company to be environmentally conscious with the Kennametal Carbide Recycling Program.

By sending us your used carbide tools, you help preserve and protect the environment and ensure that these products are recycled responsibly. Kennametal accepts any coated or non-coated carbide items, including inserts, drills, reamers, and taps.

By using the Kennametal Carbide Recycling Program, you will receive:



- A partner who cares about a sustainable environment.
- Easy-to-use web portal to value your used carbide.
- Access to our popular Green Box™ options for carbide collection.
- Systematic and efficient disposal of carbide materials.
- Improved profitability.



Program is not currently available in all geographical areas.
For more information, please visit **kennametal.com/carbiderecycling**.

KENNAMETAL®

kennametal.com

- For internal and external threading on most types of workpiece materials.
- One tool is used for both right- and left-hand threads.
- All cutters have through-coolant capability.
- Utilizes inserts with various profiles and pitches.

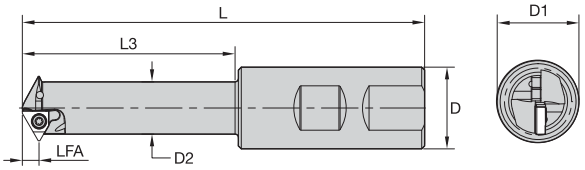
KTMD U Series

Primary Application

With a wide range of insert thread sizes and grades for most materials, KTMD U is a multiflute, single-point, high-productivity, and economical solution for milling threads in deep-hole applications.

Features and Benefits

Smooth Cutting Action



- Reduced load on the cutting edges due to single-point insert.
- Low cutting forces enable fast machining.
- Suitable for hard material applications.
- Wide range of applications, with partial profile insert (60°/55°).
- Pitch range 16–3 TPI (1,5–8mm).

Cost-Effective Solution

- Up to three cutting edges per insert.
- Very high feed per tooth.
- Fast machining.
- Multiflute — up to 7 cutting edges (inserts).

Comprehensive cutter bodies offering:

- Weldon®, steel, carbide, and shell mill cutters available.
- Long overhang capability.
- Through coolant capability.
- Diameter range 0.5–1.2" (2" with shell mills).
- Improved chip evacuation and cooling.

TM-CNC Generator for CNC Programming on our website under: **http://www.kennametal.com/en/resources/software.html**.

TMS Series

Primary Application

The TMS series, a Kennametal Thread Milling System, is a versatile thread milling product with proven solutions. This tool is specially designed for internal and external threading on most types of workpiece materials. The cutter body utilizes inserts with various profiles and pitches.

Features and Benefits

Proven solution and versatile indexable thread milling product family.

Comprehensive Offering of Cutter Bodies

- Standard Weldon®, Mini Weldon, long-thread Weldon, conical shank, and double-sided Weldon cutters are available.
- One tool is used for both right- and left-hand threads.
- All cutters have through coolant capability.

Double-Sided Weldon Cutter Bodies

- Provides faster machining capabilities.
- Good surface finish.

Inserts:

- Insert grades for most workpiece materials.
- Inserts for ISO, UN, BSPT, and NPT thread profiles.
- Indexable inserts.
- Economical and cost effective.
- Versatile application.

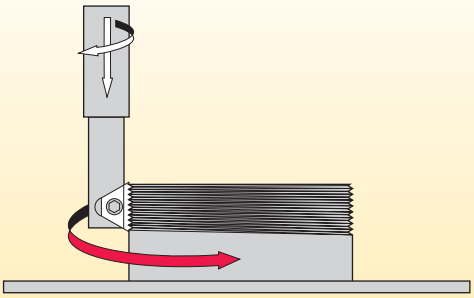
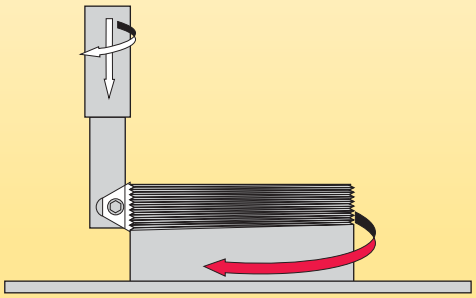
NOTE: Use Kennametal thread mill software:
TM-CNC Generator for CNC Programming on our website under: **http://www.kennametal.com/en/resources/software.html**.

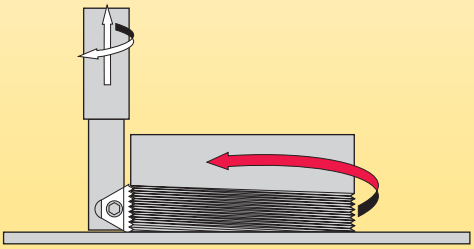


The Following Are a Few Thread Milling Methods (Work Directions)

NOTE: Climb milling results in lower cutting forces, better chip development, higher thread surface quality, and longer insert life. Therefore, it should be used whenever possible. But, in the case of some hardened materials or when milling certain difficult-to-machine exotic materials, conventional milling may be preferred.



Methods of External Thread Milling



right-hand thread... conventional milling

left-hand thread... conventional milling

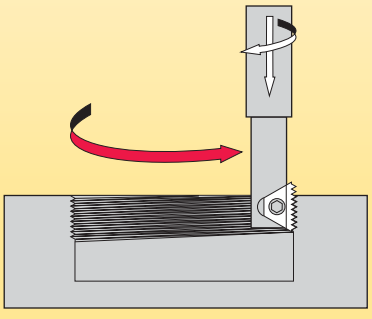
Methods of Internal Thread Milling



right-hand thread... conventional milling

left-hand thread... conventional milling

right-hand thread... climb milling

left-hand thread... climb milling

Application Guidelines

- All thread milling inserts are full profile or cresting type.
- Inserts are designed to mill full thread depth in one revolution or pass.
- When machining difficult materials, two passes may be desired. A 60% thread depth on the first pass and a 40% thread depth on the second pass is recommended.
- Thread relief grooves in blind holes are not necessary.
- Thread milling large parts requires considerably less horsepower compared to other threading methods.
- Thread milling produces short chips compared to stringy chips of other threading methods.
- One holder is suitable for many different thread pitches.
- PVD-coated inserts provide maximum tool life for a wide variety of materials.

NOTE: Applications in this area may be machined with special inserts and cutter bodies. Quoted on request.

Understanding Thread Milling

In order to perform a thread milling operation, a milling machine with three-axis control, capable of helical interpolation, is required. Helical interpolation is a CNC function producing tool movement along a helical path. This helical travel combines circular movement in one plane with a simultaneous linear motion in a plane perpendicular to the first. For example, the path from point A to point B (figure A) on the envelope of the cylinder combines a circular movement in the X and Y plane with a linear movement in the Z direction.

On most CNC systems, this function can be executed in two different ways:

- G02: helical interpolation in a clockwise direction
- G03: helical interpolation in a counterclockwise direction

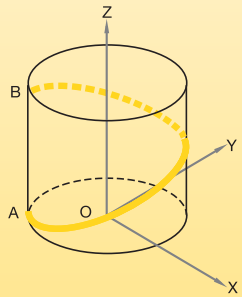
The thread milling operation (figure B) consists of circular rotation of the tool about its own axis together with an orbiting motion along the bore or workpiece circumference.

During one such orbit, the tool will move vertically one pitch length. These movements, combined with the insert geometry, create the required thread form.

There are two acceptable ways of approaching the workpiece with the tool to initiate production of the thread:

1. Along a tangential arc.
2. Along a tangential straight line.

NOTE: Climb milling is preferred.



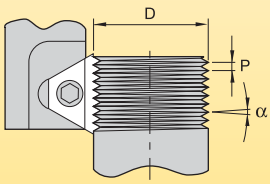


figure A

α - helix angle
D - external diameter
P - pitch

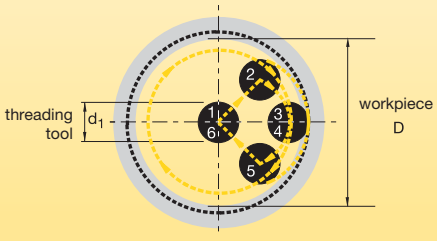

figure B

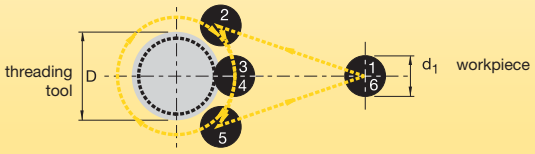
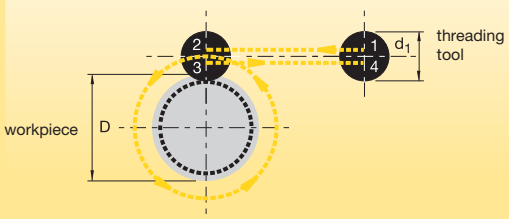
Tangential Approach (Arc)



With this method, the tool enters and exits the workpiece smoothly. No marks are left on the workpiece and there is no vibration, even with harder materials.

Although it requires slightly more complex programming, this is the method recommended for machining the highest quality threads.

1–2:	rapid approach
2–3:	tool entry along tangential arc with simultaneous feed along Z-axis
3–4:	helical movement during one full orbit (360°)
4–5:	tool exit along tangential arc with continuing feed along the Z-axis
5–6:	rapid return



internal left-hand thread

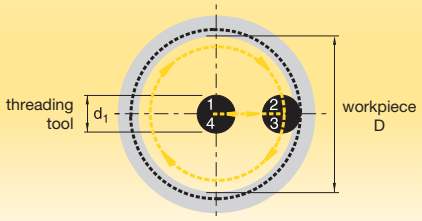
external thread

Tangential Approach (Line)

This method is very simple and has all of the advantages of the tangential arc method. However, it is applicable only to external threads.

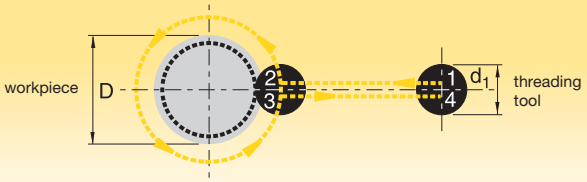
1–2:	radial entry with simultaneous feed along the Z-axis
2–3:	helical movement during one full orbit (360°)
3–4:	radial exit

Radial Approach



This radial approach is often considered the simplest. There are two characteristics worth noting about the radial approach:

a. A small vertical mark may be left at the entry (and exit) point. This is of no significance to the thread itself.



b. When using this method with very hard materials, there may be a tendency for the tool to vibrate as it approaches the full cutting depth.

1–2:	radial entry
2–3:	helical movement during one full orbit (360°)
3–4:	radial exit

NOTE: Radial feed during entry to the full profile depth should be only 1/3 of the subsequent circular feed.

internal thread

external thread

Calculation of Feed Rates at the Cutting Edge

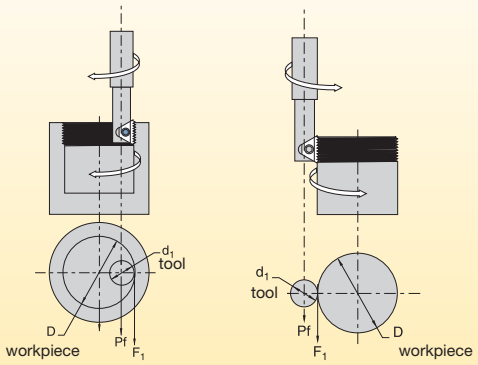
The first step is to calculate the tool feed rate at the cutting edge:

$$F_1 = fz \times Z \times n$$

F_1 = tool feed rate at the cutting edge (in/min)
fz = inch per tooth (feed rate)
Z = number of effective inserts in cutter
n = rotational speed (spindle RPM)

The rotational speed (RPM) is calculated by the following formula:

$$RPM = \frac{12 \times SFM}{\pi \times d_1}$$



SFM = cutting speed, surface feet per minute
d_1 = cutter diameter, over insert
π = 3.1416

Calculation of Program Feed Rate

On most CNC machines, the feed rate required for programming is at the centerline of the tool. When dealing with linear tool movement, the feed rate at the cutting edge and the centerline are identical. With circular tool movement this is not the case. The following equations define the relationship between feed rates at the tool centerline.

$$P_1 = F_1 + \frac{(F_1 \times d_1)}{D}$$

P_1 = program feed rate (in/min)
D = major diameter (external thread)
D = minor diameter (internal thread)
d_1 = cutting diameter, over insert

external thread internal thread

tool workpiece

Step-by-Step Thread Milling Example

thread: internal right hand 11/4 x 16 UN–2B–RH(21)

material: AISI 4140 (300 HB)

thread diameters: D (minimum bore dia.) = 1.182"

Do (nominal dia.) = 1.25"

thread length: .50"

For best thread quality, the cutter with the largest d1 (cutter diameter) should be used. This cutter diameter can be found in the table on page W49, as a function of pitch and minimum bore diameter "D". The result for the above example is that any cutter diameter 1.02" or smaller can be utilized.

A cutter with a smaller d1 will perform the thread milling operation in less time. The smaller d1 may result in less tool rigidity, so it should be used with caution on very tough materials.

Find the appropriate normal-length shank cutter diameter on pages W40–W43. Use the minimum bore diameter table below for reference.

pitch (TPI)	24	20	16	12
pitch mm	1,0	1,25	1,5	2,0
cutter dia. d_1	minimum bore diameter D			
.67	.748	.772	.787	.827
.75	.827	.850	.866	.906
.79	.866	.890	.906	.945

Figure B: cutter selected: K079TMIRW075STN16N
outer dimensions: d_1 = .79, R_t (radius of tool) = $d_1 \div 2$ = .395"

Choosing Insert Size

The insert IC is defined by the selected cutter (STN16).
Use the appropriate insert table on pages W44–W46.

insert IC	a inch (mm)	pitch (TPI)	internal thread catalog number	b inch thread length (in)	number of teeth	grade KC610M	grade KC620M	external thread catalog number	b inch thread length (in)	number of teeth	grade KC610M	grade KC620M	cutter type

insert selected: STN16 16UN-I

■ stock standard
□ non-stock standard

Step-by-Step Thread Milling Example

Calculate the feed rates:

First, find the RPM.

$$RPM = \frac{12 \times SFM}{\pi \times d_1} = \frac{12 \times 500}{3.14 \times .79} = 2418 \text{ RPM}$$

Next, calculate the feed rate at the insert cutting edge (F_1):

(using the chosen feed per tooth of .004.)

$$F_1 = IPT \times nt \times RPM = .004 \times 1 \times 2418 = 9.67 \text{ in/min}$$

Finally, calculate the feed rate at the cutter centerline (F_2):

$$F_2 = \frac{F_1 \times (D - d_1)}{D} = \frac{9.67 \times (1.182 - .79)}{1.182} = 3.207 \text{ in/min}$$

Select the thread milling method.

Climb milling (preferred) see page W48.

Calculate the radius of the tangential arc R_e:

$$R_e = \frac{(R_i - C_L)^2 + R_0^2}{2R_0} = \frac{(.591 - .02)^2 + .625^2}{2 \times .625}$$

$$R_e = .573333 \text{ in.}$$

Calculate the angle (β):

$$\beta = 90° + \arcsin \frac{R_0 - R_e}{R_e}$$

$$\beta = 90° + \arcsin \frac{.625 - .573333}{.57333}$$

$$\beta = 90° + 5.17° = 95.17° = 95° 10'$$

Calculate the movement along the Z-axis during the entry approach from point "A" to point "B" ($Z\alpha$).
(NOTE: P = pitch)

$$Z\alpha = P \text{ (in)} \times \frac{\alpha°}{360°} = \frac{.0625}{4} = .0156 \text{ in, because } \alpha = 90°$$

Calculate the "X" and "Y" values at the start of the entry approach.

$$X = 0Y = -R_i + C_L = -.591 + .02 = -.571 \text{ in.}$$

Define Z-axis location at the start of the entry approach.
(NOTE: L = length of thread)

$$Z = -(L + Z\alpha) = -(.50 + .0156) = -.5156 \text{ in.}$$

Define the starting point.

$X_a = 0$

$Y_a = 0$

α 90°

Step-by-Step Thread Milling Example

Appendix A

Derivation of Formulas for Internal Thread Milling

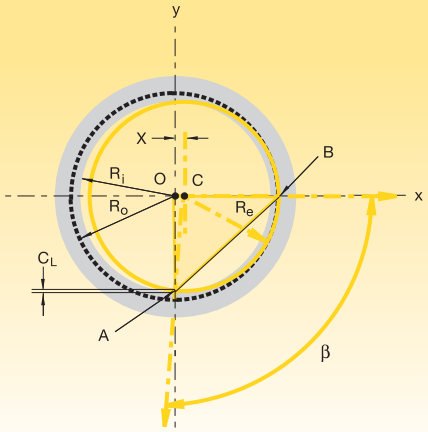
R_e, β, and X can be found by a geometric analysis of the entry path.

This entry path is defined by the tool traveling along a circular path, with a radius of R_e about the point C.

$$R_e = \frac{(R_i - C_L)^2 + R_o^2}{2R_o}$$

Triangle OAC enables us to simply solve for R_e.
Note that OAC is a right angle triangle, and that:

$OA = R_i - C_L$
$CA = R_e$
$OC = R_o - R_e$



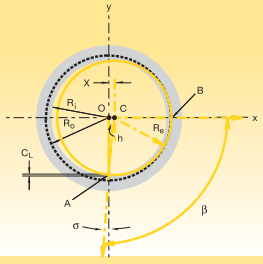
Pythagoras' law states: $OA^2 + OC^2 = AC^2$

Replacing actual values, we get:

$$(R_i - C_L)^2 + (R_o - R_e)^2 = R_e^2$$

Simplifying, we get:

$$R_e = \frac{(R_i - C_L)^2 + R_o^2}{2R_0}$$



Find the angle β.

$\beta = 90° + \sigma$

$\sin \sigma = \frac{OC}{CA} = \frac{(R_o - R_e)}{R_e}$

$\sigma = \text{arc sin} \left(\frac{R_o - R_e}{R_e}\right)$

Therefore, $\beta = 90° + \text{arc sin} \left(\frac{R_o - R_e}{R_e}\right)$

Appendix B

Derivation of Formulas for External Thread Milling

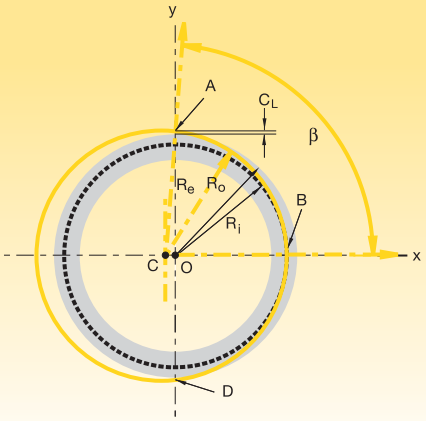
R_e, β, and X can be found by a geometric analysis of the entry path.

This entry path is defined by the tool traveling along a circular path, with a radius of R_e about the point C.

$$R_e = \frac{(R_o - C_L)^2 + R_i^2}{2R_i}$$

Triangle OAC enables us to simply solve for R_e.
Note that OAC is a right angle triangle, and that:

$OA = R_o - C_L$
$CA = R_e$
$OC = R_e - R_i$



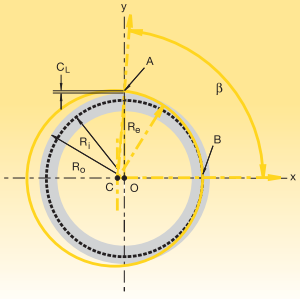
Pythagoras' law states: $OA^2 + OC^2 = AC^2$

Replacing actual values, we get:

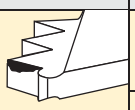
$$(R_o - C_L)^2 + (R_e - R_i)^2 = R_e^2$$

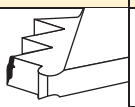
Simplifying, we get:

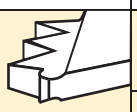
$$R_e = \frac{(R_o - C_L)^2 + R_i^2}{2R_i}$$



Find the angle β.







β can be easily found using the same triangle:

$\sin \beta = \frac{AO}{AC} = \frac{(R_o + C_L)}{R_e}$

$\beta = \text{arc sin} \left(\frac{R_o + C_L}{R_e}\right)$

Thread Mill Troubleshooting

problem	possible cause	solution
excessive insert flank wear 	• Cutting speed too high.	• Reduce cutting speed.
	• Chip is too thin.	• Increase feed rate.
	• Insufficient coolant.	• Increase coolant quantity/pressure.
chipping of cutting edge 	• Chip is too thick.	• Reduce feed rate. • Use the tangential arc method of entrance. • Increase RPM.
	• Vibration.	• Check rigidity.
material build-up on the cutting edge 	• Cutting speed too slow.	• Increase cutting speed.
	• Chip thickness too small.	• Increase feed rate.
chatter/vibration	• Feed rate is too high.	• Reduce the feed.
	• Profile is too deep (coarse pitch threads).	• Execute two passes, each with increased cutting depth. • Execute two passes, each cutting only half the thread length.
	• Thread length is too long.	• Execute two passes, each cutting only half of the thread length.
insufficient thread accuracy	• Tool deflection.	• Reduce feed rate. • Execute a zero cut.

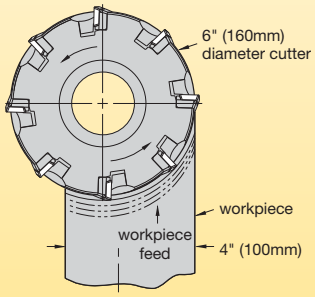
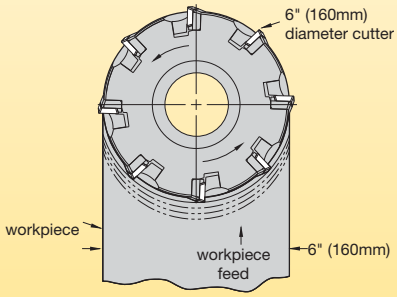
Bit Adapter

Order Number	Catalog Number	Drive Size	Description
1963869	**DRIVER**	hex 1/4"	Bit Adapter suitable for standard and extended length 1/4" drive bits



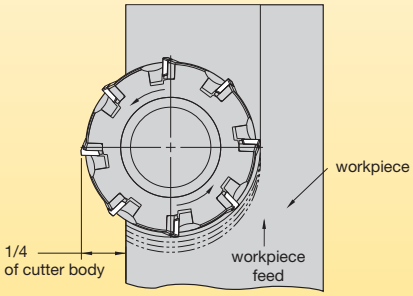
Workpiece dimensions determine the best face mill diameter to select.

Cutter-to-part width-of-cut ratio should be approximately 3:2 or 1 1/2 times the part width. For example, if the width of cut is 4" (100mm), choose a 6" (160mm) diameter cutter. If the width is extremely wide, select a cutter diameter that matches the spindle capacity and take multiple passes. For example, if the width of cut is 24" (610mm) and the machine has a standard #50 taper spindle, you should use an 8" (200mm) diameter cutter and take five passes, at slightly less than 5" (125mm) per pass, or four passes at 6" (160mm) per pass, depending on horsepower and rigidity.



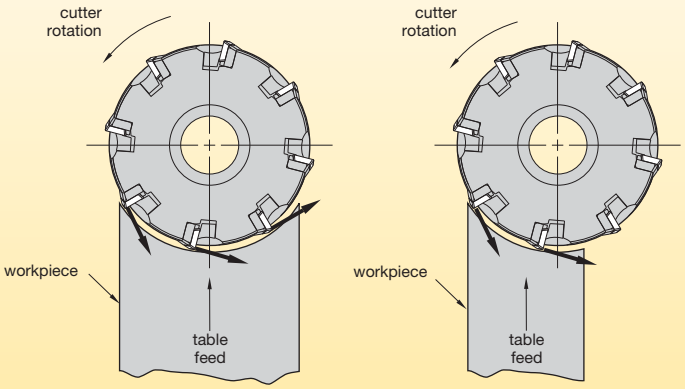
An undesirable situation is when the cutter diameter is about equal to the width of cut. The chip being formed at the entrance and exit of the cut will be very thin. The thin chips formed cannot carry away heat as well as thicker chips; therefore, the heat is transferred back into the insert causing premature edge failure. Work-hardening is also more likely to occur in the entry and exit area.

When the proper cutter diameter is not available, proper cutter positioning will provide positive results.



- Position cutter with approximately 1/4 of the cutter body outside the workpiece and make two passes.
- Produces negative angle of entry (desirable).
- Can result in longer tool life.

desirable



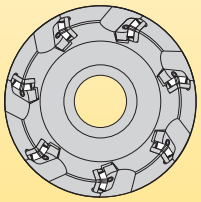
undesirable

cutter position

Cutter Positioning/Cutting Forces

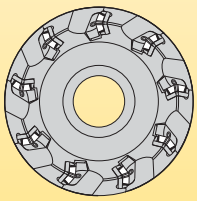
The cutting forces are constantly changing as the inserts move through the cut. We should understand that in changing the position of the cutter in relation to the workpiece, we can re-direct the cutting forces. This is important to ensure a safe operation based on fixture design, workpiece design, and workpiece considerations.

Pitch, or density, refers to the number of inserts in a cutter. Cutters can be classified as having either coarse, medium, or fine pitch. When designing a cutter, the engineer must take the depth of cut and feed per tooth into consideration. He then must provide the necessary chip clearance in the body so that the chip can pass without restricting its formation. For this reason, cutters designed for heavy metal removal have maximum chip clearance. This, therefore, restricts the number of inserts in the cutter, making it a coarse pitch cutter.



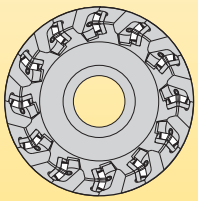
In medium pitch cutters, the chip clearance area in the body is usually slightly smaller than a coarse pitch cutter. And, in fine pitch cutters, the chip clearance is considerably less.

Coarse pitch is recommended for general purpose milling where adequate horsepower is available, and where maximum depth of cut is required.



Medium pitch is recommended when moderate feed per insert is required, and where it is more advantageous to have more than one insert in the cut. Medium pitch also reduces entry shock and cutting pressure while maintaining feed rates.

Fine pitch is ideal when milling a severely interrupted surface such as a manifold block. Fine pitch cutters are capable of higher inch/mm per minute feed rates than medium or coarse pitch cutters. They also experience higher cutting forces and greater horsepower consumption than medium or coarse pitch cutters do.



Differential pitch is a differential-pitch milling cutter with unequally spaced inserts. This configuration breaks up the harmonics that result from equally spaced inserts, greatly reducing the chance of vibration. Most cutters use this design regardless of the cutter pitch.

medium pitch

fine pitch

differential pitch

Lead Angles/Cutting Forces on Workpiece and Fixturing

Cutting forces produced during the milling process are constantly changing as the insert moves through the cut. Understanding the relationship of these forces will help ensure safe operation by preventing workpiece movement during the cut. For example, fixture design and clamp positioning are determined by the cutting forces produced in milling. Equally important is an understanding of the effect lead angle has on cutting force direction, actual chip thickness, and tool life.

0° Lead Angle

Advantages:

- When 90° shoulder is required.
- Can be a problem solver on thin wall workpieces.

Disadvantages:

- Highest radial cutting forces.
- High entry shock load.
- Increased chance of bur on insert exit side of part.

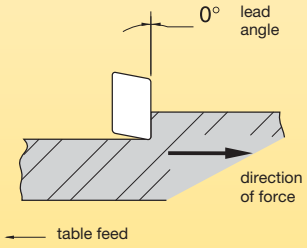
15° and 20° Lead Angle

Advantages:

- For general milling applications and relatively rigid conditions.
- Good relation of insert size and maximum depth of cut.
- Reduced entry shock load.

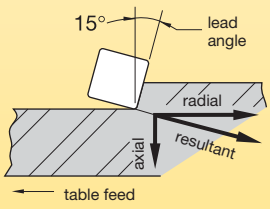
Disadvantages:

- Higher radial forces can cause problems in weak machine/workpiece/fixture conditions.



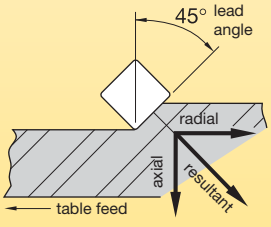
45° Lead Angle

Advantages:



- Well-balanced axial and radial cutting forces.
- Less breakout on workpiece corner.
- Entry shock minimized.
- Less radial forces directed into spindle bearings.
- Higher feed rates possible.

Disadvantages:



- Reduced maximum depth of cut due to lead angle.
- Larger body diameter can cause fixture clearance problems.

(continued)

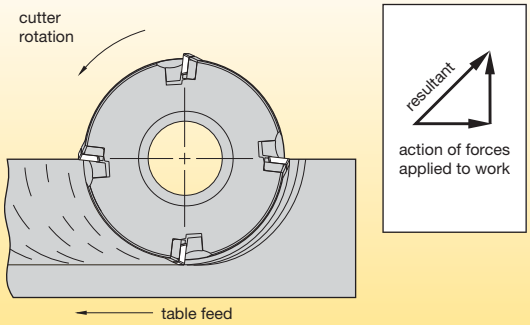
Lead Angle/Chip Thickness

Chip thickness is affected by lead angle. The greater the lead angle, the thinner the chip will be since it's distributed over a greater length of the cutting edge. To achieve greater productivity and problem-free milling, use a lead angle cutter whenever possible.

lead angle	feed per tooth	actual chip thickness "B"
0°	A	A
15°	A	.96 x A
20°	A	.94 x A
30°	A	.86 x A
45°	A	.707 x A

example:

0°	.010" (0,25mm)	.010" (0,25mm)
15°	.010" (0,25mm)	.0096" (0,25mm)
20°	.010" (0,25mm)	.0094" (0,24mm)
30°	.010" (0,25mm)	.0086" (0,22mm)
45°	.010" (0,25mm)	.0071" (0,18mm)



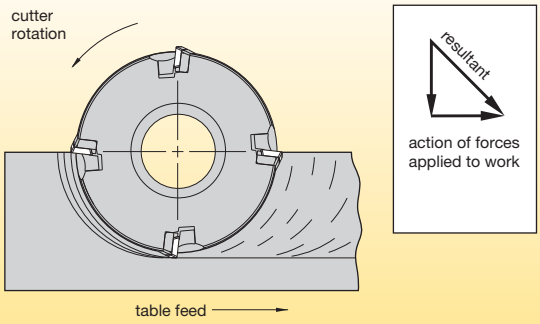
On round inserts, the chip load and lead angle vary with the depth of cut.

lead angle/chip thickness

Conventional Milling

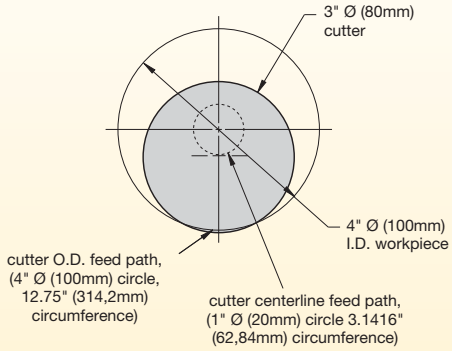
For many years, it was common practice to mill against the direction of the feed due to the use of high-speed steel cutters and an absence of backlash-eliminating devices. The milling procedure became known as conventional, or up-milling.

In conventional milling, friction and rubbing occur as the insert enters into the cut, resulting in chip welding and heat dissipation into the insert and workpiece. Resultant forces in conventional milling are against the direction of the feed. Work-hardening is also likely to occur.



conventional milling

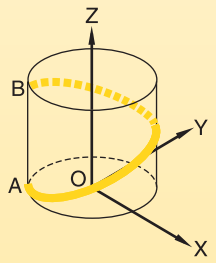
Climb Milling (preferred)



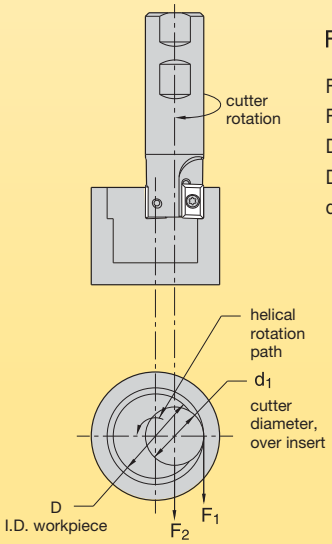
Climb milling is normally recommended. The insert enters the workpiece material with some chip load and produces a chip that thins as it exits the cut. This reduces the heat by dissipating it into the chip. Work-hardening is minimized.

Climb milling forces tend to push the workpiece toward the fixture and in the direction of the feed. Climb milling is preferred over conventional milling in most situations.

climb milling



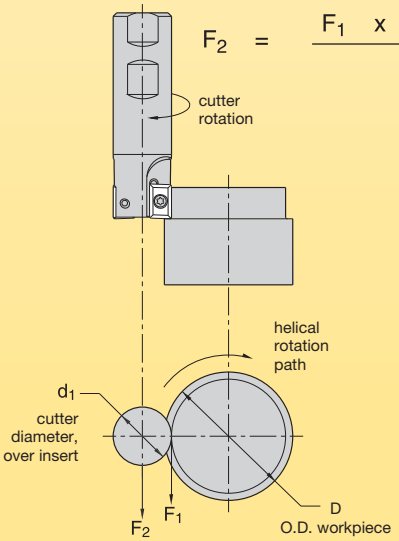
Circular Interpolation: Consists of a cutter rotating about its own axis while traveling in an orbiting motion about an I.D. or O.D. workpiece circumference without any vertical shift during the operation. This orbiting movement utilizes the "X" and "Y" axis.



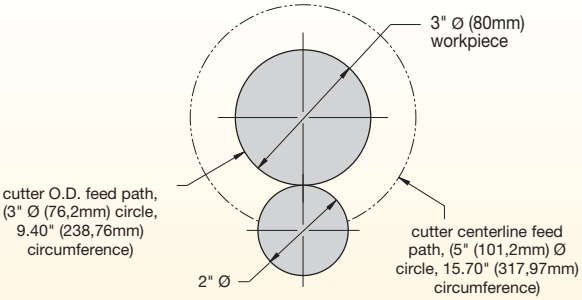
I.D. circular interpolation

Helical Interpolation: This application requires a milling machine with three-axis control capability. The operation consists of a cutter rotating about its own axis together in an orbiting motion about an ID or OD workpiece circumference in the "X" and "Y" plane. The circular movement about the "X" and "Y" plane, with a simultaneous linear movement in the Z-axis plane (which is perpendicular to the "X" and "Y" plane), creates the helical movement. For example, the path from point A to point B on the envelope of the cylinder combines a circular movement in the "X" and "Y" plane with a linear movement in the "Z" direction. On most CNC systems, this function can be executed in two different ways:

- GO2: helical interpolation in a clockwise direction.
- GO3: helical interpolation in a counterclockwise direction.



helical interpolation



inside diameter (I.D.) helical interpolation

$$F_2 = \frac{F_1 \times (D - d_1)}{D}$$

F_1 = tool feed rate at the cutting edge (in./min.)
F_2 = tool centerline feed rate (in./min.)
D = O.D. workpiece diameter
D = I.D. workpiece diameter
d_1 = cutter diameter, over insert

outside diameter (O.D.) helical interpolation

O.D. circular interpolation

Calculation of Feed Rate for Circular and Helical Interpolation: On most CNC machines, the feed rate required for programming contour (circular or helical) milling is calculated based on the centerline of the tool. When dealing with linear tool movement, the feed rate at the cutting edge and centerline are identical, but with circular tool movement, this is not the case.

Calculate Feed Rate at the Cutting Edge: First calculate the tool feed rate at the cutting edge with the following formula.

$F_1 = fz \times z \times n$

F_1 = tool feed rate at the cutting edge (in./min.)

f_z = inch per tooth (chip load)

z = number of effective inserts in the cutter

n = revolutions per minute

Calculation of the Feed Rate at the Tool Centerline: Use the following equations to define the relationship between feed rates at the cutting edge and at the tool centerline.

$$F_2 = \frac{F_1 \times (d_1 + D)}{D}$$

(continued)

(continued)

In I.D. contour applications, you will find the tool centerline feed is always less than the cutting edge feed rate.

Example for I.D.

D = 4" (100mm) I.D. workpiece

d_1 = 3" (80mm) cutter diameter

fz = .008 IPT (0,2 mm/tooth)

n = 637 RPM

z = 7 effective inserts

1. Calculate feed rate at the cutting edge.

$F_1 = f_2 \times z \times n$

F_1 = .008 x 7 x 637 = 35.7 in./min (0.2 x 7 x 637 = 892 mm/min)

2. Calculate feed rate at the tool centerline.

$$F_2 = \frac{F_1 \times (D - d_1)}{D}$$

$$F_2 = \frac{35.7 \times (4.0 - 3.0)}{4.0} = 8.9 \text{ in./min}$$

$$F_2 = \frac{892 \times (100 - 80)}{100} = 178 \text{ mm/min}$$

To have (F_1) 35.7 in/min (892 mm/min) at the cutting edge feed rate, we must program the machine tool for (F_2) 8.9 in/min (178 mm/min) at the tool centerline feed rate. This is a difference of approximately 75% less feed than the cutting edge feed rate (F_1).

In O.D. contour applications, you will find the tool centerline feed rate is always larger than the cutting edge feed rate.

Example for O.D.

D = 5" (125mm) O.D. workpiece

d_1 = 2" (50mm) cutter diameter

f_z = .008 IPT (0,2 mm/tooth)

n = 955 RPM

z = 5 effective teeth

1. Calculate feed rate at the cutting edge.

$F_1 = f_2 \times z \times n$

F_1 = .008 x 5 x 955 = 38.2 in./min (0.2 x 5 x 955 = 955 mm/min)

2. Calculate feed rate at the tool centerline.

$$F_2 = \frac{F_1 \times (d_1 + D)}{D}$$

$$F_2 = \frac{38.2 \times (2 + 5)}{5} = 53.5 \text{ in./min}$$

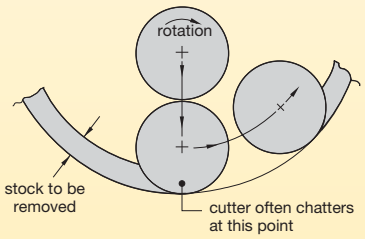
$$F_2 = \frac{955 \times (50 + 125)}{125} = 1{,}337 \text{ mm/min}$$

To have (F_1) 38.2 in/min (955 mm/min) at the cutting edge feed rate, we must program the machine tool for (F_2) 53.5in/min (1,337 mm/min) at the tool centerline feed rate. This translates to an increase of about 40% more feed rate than the cutting edge feed rate (F_1).

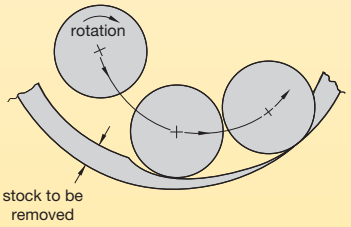
Large Surfaces

Interpolating with a smaller cutter may be faster than using a large diameter cutter. Also, keep the cutter in contact with the workpiece rather than exiting and re-entering.

Maximize Metal Removal Rate



Concentrate on Metal Removal Rate (MRR), not just on higher SFM (cutting speeds). Increasing spindle speed without increasing chip load will not improve MRR. However, by doubling fz, MRR does increase and horsepower consumption only increases by approximately 50%.

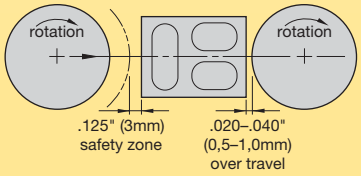


Preset

Use cutter preset areas for proper setting of cutters rather than indexing cutters at the machine, if possible.

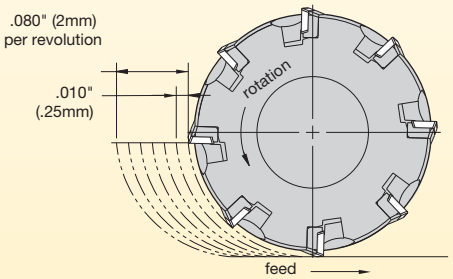
Ramp In and Out

As shown below, ramping gradually into the cut will provide greater tool life. Also, by keeping the cutter constantly moving when entering and exiting the cut, dwell marks will be eliminated on the workpiece.



Safety and Over Travel

Program the milling cutter to rapid advance up to the part, within a range of .125" (3mm) before engaging the workpiece. This allows the machine to reach its proper operating parameters before actual chip making begins.



Rapid advance to the next cutting location, when the cutter is .020" (0,5mm) to .040" (1mm) past the edge of the part. If the spindle has built-in tilt or programmed runout, the cutter can be advanced to the next cutting location while the back half of the cutter is still over the finished milled surface.

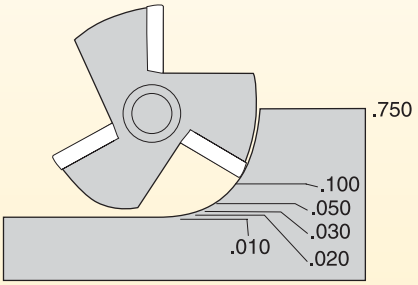
Slotting or Periphery Milling

True or actual chip load on the cutting edge of the insert is equal to the programmed chip load only when 50% or more of the cutter's diameter is engaged in the cut (lead angle not considered). Anything less than half the diameter of the cutter means that the actual chip load is reduced by some percentage. The smaller the radial depth of cut, the greater the decrease in actual chip load.

It's very important to maintain a chip load which is great enough to ensure heat dissipation and prevent work hardening. A sufficient chip load will also create stability between the cutter and the workpiece.

The formulas shown below are used to determine the programmed chip load, or feed rate necessary to obtain the desired load on the insert cutting edge as it enters the workpiece. These formulas should be applied whenever an arbor mounted slotting cutter is being used, or when less than half the diameter of a face mill or end mill is engaged in the cut. The lighter the radial depth of cut, the more important it becomes to apply these productivity formulas.

Productivity Formulas



$$\text{chip load (fz)} = \frac{\left(\frac{\sqrt{(\text{dia.} - y) \times (y)}}{\text{radius}}\right) \times \left(\frac{vf}{n}\right)}{z}$$

or

$$F = \frac{n \times z \times fz}{\left(\frac{\sqrt{(\text{dia.} - y) \times (y)}}{\text{radius}}\right)}$$

Operations such as **periphery milling with a light radial depth of cut or slotting with an arbor mounted cutter** require a calculation for feed rate compensation to maintain the proper chip load on the insert edge at entry into the cut. The calculated chip load and actual chip load can be dramatically different, depending on the radial depth and the cutter diameter. For instance, the actual chip load on entry for a 3/4" diameter cutter taking a .010" radial depth cut is only 23% of the calculated chip load. It is not uncommon to encounter built-up edge, work-hardening, or chatter problems if the following formula is not applied. Minimal cutter runout is critical to obtaining an equal chip load on each flute of the cutter too. A side benefit to applying this formula is increased productivity as feed rates can increase dramatically.

radial depth of cut	actual chip load (IPT)	feed required (IPM) to maintain .004 IPT	increase
.750	.0040	5.5	0%

.004 IPT 5.5 IPM

Formulas — Horsepower

Metal Removal Rate

The Metal Removal Rate (MRR) calculation is a good basis for determining metalcutting efficiency.

MRR = doc x woc x F = cu. inches/min.

Horsepower Consumption

Milling cutters can consume significant amounts of horsepower. Very often it is the lack of horsepower that is the limiting factor when deciding on a particular operation. On applications where large diameter cutters or heavy stock removal is necessary, it's advantageous to first calculate the necessary horsepower requirements.

NOTE: Spindle efficiency "E" varies from 75 to 90%.

(E = .75 to .90)

A suitable formula for calculating horsepower (HP_c) at the cutter is:

$$HP_c = \frac{MRR}{K}$$

example:
width of cut . . . . 1.64"
depth of cut 200
feed . . . . . 19.5 IPM
4140 220 HB . . . . . "K" factor 1.56

MRR = .200 x 1.64 x 19.5 = 6.4 cu. in/mi

$$HPc = \frac{6.4}{1.56} = 4.1 \text{ HP at the cutter}$$

For horsepower at the motor (HP_m), use formula:

$$HPm = \frac{HPc}{E} \qquad HPm = \frac{4.1}{.8} = 5.1$$

In determining horsepower consumption, "K" factors must be used. The "K" factor is a power constant that represents the number of cubic inches of metal per minute that can be removed by one horsepower.

NOTE: "K" factors vary depending on the hardness of the material.

"K" Factors

workpiece material	hardness	"K" factor
steels, and wrought and cast irons (plain carbon alloy steels, and tool steels)	85–200	1.64
	201–253	1.56
	254–286	1.28
	287–327	1.10
	328–371	.88
	372–481	.69
	482–560	.59
	561–615	.54
precipitation hardening stainless steels	150–450	1.27–.42
cast irons (gray, ductile, and malleable)	150–175	2.27
	110–190	2.0
	176–200	1.89
	201–250	1.52
	251–300	1.27
	301–320	1.19
stainless steels, and wrought and cast irons (ferritic, austenitic, and martensitic)	135–275	1.54–.76
	286–421	.74–.50
titanium	250–375	1.33–.87
high-temperature alloys, nickel, cobalt base	200–360	.83–.48
iron base	180–320	.91–.53
nickel alloys	80–360	.91–.53
aluminum alloys	30–150 (500 kg)	6.25–3.33
magnesium alloys	40–90 (500 kg)	10.0–6.67
copper	150	3.33
copper alloys	100–150	3.33
	151–243	2.0

Over the past 50 years, Metal Removal Rates (MRR) and power constants have served as the conventional values used to calculate horsepower. Although this is a relatively common method of calculating horsepower, a more accurate method has been developed when milling with high shear cutters. This new approach utilizes the following information:

1. calculating tangential force (F_t)
2. ultimate material strength
3. cross-sectional area of the chip
4. number of inserts in the cut
5. machinability factor
6. tool wear factor
7. calculating torque
8. calculating horsepower at cutter
9. calculating horsepower at motor

Tangential Force, Torque, and Horsepower Calculations in Face Milling with High Shear Milling Cutters

1. Calculation of tangential force (ft. lbs.)

Calculation of tangential force is important since it produces torque at the spindle and accounts for the greatest portion of machining power at the cutting tool. Using this tangential force formula is a quick way to determine the approximate forces that fixtures, part wall sections, or spindle bearings will endure. Tangential force is calculated with the following formula:

$$F_t = S \times A \times Z_c \times C_m \times C_w \text{ (N)}$$

where: S = ultimate strength of the work material (psi)
A = cross-sectional area of the chip removed by the milling insert (in^2)
Z_c = number of inserts in cut
C_m = machinability factor
C_w = tool wear factor

2. Ultimate material strength (psi)

The approximate relationship between the ultimate material strength and hardness of the most commonly used work materials such as steels, irons (for example: gray cast iron), titanium alloys (Ti – 6Al – 4V), and aluminum alloys (2024, 5052) can be expressed by the empirical formula:

$$S = 500 \times HB \text{ (psi)}$$

Where HB = Brinell hardness numbers obtained, primarily, at the 3000-kgf load. When testing soft metals such as aluminum alloys, the 500-kgf load is used. Hardness obtained at the 500-kgf load should be converted into the hardness equivalent of the 3000-kgf load by using the load factor of 1.15.
For example, 130 HB at the 500-kgf load is equivalent to 150 HB at the 3000-kgf load (130 x 1.15 = 150). If hardness is given in Rockwell "B" or Rockwell "C" numbers, see the Material Listing Overview on pages Y210-Y211.

3. Cross-sectional area of the chip (A)

Cross-sectional area of the chip (Fig. 1) is defined by:

where: A = d f (in^2, or mm^2)
d = axial depth of cut (in, or mm)
fz = feed per tooth (in, or mm)

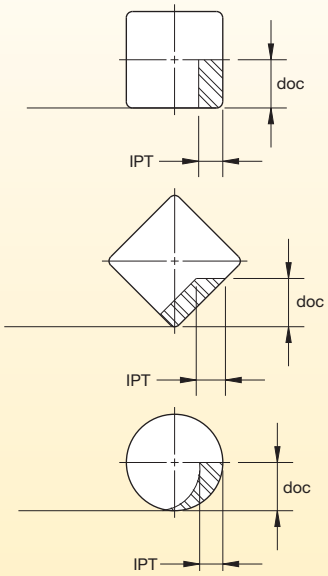

Figure 1: Cross-sectional area of the chip and insert's shape

4. Number of inserts in cut (Zc)

The number of inserts in the cut (simultaneously engaged with work material) depends on the number of inserts in the cutter "Z" and the engagement angle (α). This relationship is shown by the formula:

$$Z_c = \frac{Z \times \alpha^\circ}{360^\circ}$$

The engagement angle depends on the width of cut "W" and cutter diameter "D". This angle is found from the geometry of figure 2 (formulas to calculate engagement angle and the number of inserts in the cut at any width of cut are given in the appendix on page X20.

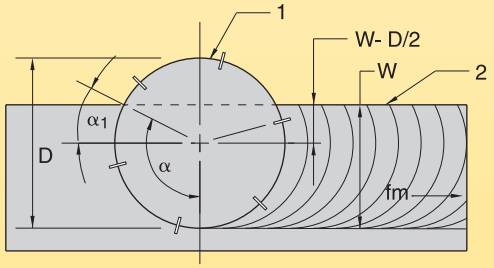

Figure 2: Schematic for calculating the number of inserts in cut

1 = milling cutter
2 = workpiece
α = engagement angle
α_1 = the angle between cutter centerline and cutter radius to the peripheral point of exit or entry
W = width of cut (woc)
D = cutter diameter
fm = workpiece feed motion

(continued)

(continued)

If the width of cut equals cutter diameter (W/D = 1.0), the engagement angle $\alpha = 180°$ and $Z_c = \frac{Z \times 180°}{360°} = 0.5Z$.

If the width of cut is equal to half of the cutter diameter (W/D = 0.5), the engagement angle $\alpha = 90°$ and $Z_c = \frac{Z \times 90°}{360°} = 0.25Z$.

The values of Z_c depending on the given W/D ratios, are shown in table 1.

Table 1

W/D	.88	.80	.75	.67	.56	.38	.33	.19	.125
Z_c	.38Z	.35Z	.33Z	.30Z	.27Z	.21Z	.20Z	.14Z	.12Z

5. Machinability factor (C_m)

Machinability factor is used to indicate degree of difficulty in machining various workpiece materials. Table 2 shows machinability factor values for some of the most common workpiece materials.

Table 2

workpiece material	C_m W/D≤.67	.67<W/D<1.0	W/D=1.0
carbon and alloy steels	1.0	1.15	1.3
stainless steel	2.0	2.15	2.3
gray cast iron	1.0	1.15	1.3
titanium alloys	1.0	1.20	1.4
aluminum alloys	1.0	1.05	1.1

The values of C_m are based on milling tests with a torque dynamometer at different cutting conditions. It has been found that machinability factor depends on type of work material and the ratio of radial width of cut to cutter diameter (W/D).

This ratio determines the uniformity of the chip thickness. When W/D = 1.0, the chip at the point of entry starts off at zero thickness. It increases to a maximum thickness at the centerline of the cutter, and thins off to zero again at the point of exit. This type of cut generates maximum friction at the cutting edge, and machinability factor reaches its maximum value. The optimal cutting conditions are obtained when W/D = 2/3 = .67. The thickness of the chip is practically uniform, the friction is minimal, and machinability factor decreases to its minimum value.

More extensive testing will determine machinability factors for a larger variety of work materials and improve the accuracy for calculating tangential force and power consumption.

6. Tool wear factor (C_w)

For milling with sharp cutting tools (short time operation), tool wear factor $C_w = 1.0$. For a longer operation (before the inserts are indexed), the following tool wear factors are considered:

- light face milling $C_w = 1.1$
- general face milling $C_w = 1.2$
- heavy-duty face milling $C_w = 1.3$

7. Calculation of torque (ft. lbs.)

The torque "T" generated by tangential force is calculated using the following formula:

$T = F_t \times D/2$ (in.-lb.)

where D = cutter diameter inch

8. Calculating horsepower (HP_c or HP_m)

The machining power at the cutter (sharp edges) is calculated by either of these two formulas:

$$HP_c = \frac{F_t \times SFM}{33{,}000}$$

or

$$HP_c = \frac{T \times RPM}{63{,}000}$$

where SFM = peripheral cutting speed (SFM)
RPM = spindle speed (RPM)
33,000 and 63,000 = conversion factors

9. The required power at the motor is calculated using the following formula (HP_m):

$$HP_m = \frac{HP_c}{E}$$

where E = machine tool efficiency factor (E = .75–.90)

NOTE: Spindle efficiency varies from 75–90%.

(continued)

(continued)

Example for Calculating Horsepower

given values:

milling cutter KSSISR – 492 – SE443 – 45 – 06:

effective diameter	D = 4.92".
number of inserts	Z = 6

workpiece material:
alloy steel AISI 4140
hardness 220 HB

machining conditions:

spindle speed	n = 349
cutting speed	Vc = 450
machine feed rate	F = 19.5
inch per tooth (chip load)	fz = .008"
axial depth of cut	doc = .200"
radial width of cut	woc = 1.64"
W/D ratio	W/D = .33

Step-By-Step Calculations

1. Calculating tangential force

1.1 ultimate strength of the workpiece material
S = 500 x HB = 500 x 220 = 110,000 psi

1.2 cross-sectional area of the chip
$A = doc \times IPT = .200 \times .008 = .0016\ in.^2$

1.3 number of inserts in cut:
width of cut-to-diameter ratio (w/d)
W/D = 1.64 / 4.92 = .33 (See Table 1, page X12).
Now use Z_c value shown in Table 1 under .33.
$Z_c = .20 \times Z = .20 \times 6 = 1.2$ inserts in cut.

NOTE: Z = number of inserts in cutter.

1.4 tangential force
$F_t = S \times A \times Z_c \times C_m \times C_w$
$F_t = 110{,}000 \times .0016 \times 1.2 \times 1.1 \times 1.1 = 256$ lbs.

NOTE: $C_m = 1.1$ and $C_w = 1.1$

2. Calculating torque at the cutter

$$T = (F_t \times D)/2 = \frac{256 \times 4.92}{2} = 630\ in.\text{-}lb.$$

3. Calculating horsepower

- At the cutter...reference formulas in paragraph 8 on page X12.

$$HP_c = \frac{F_t \times SFM}{33{,}000} = \frac{256 \times 450}{33{,}000} = 3.5\ hp$$

or

$$HP_c = \frac{T \times RPM}{63{,}000} = \frac{630 \times 349}{63{,}000} = 3.5\ hp$$

- At the motor...reference formula in paragraph 9 on page X12.
- Where E = machine tool efficiency factor (E = .75 to .90).

$$HP_m = \frac{HP_c}{E} = \frac{3.5}{.8} = 4.4\ hp$$

Surface finish may be an important specification on a machined part. Finishes produced by indexable insert cutters usually range from 0.80–3.2 (32–150) Ra. This broad range can be affected by several variables such as work material, machine rigidity, spindle alignment, fixturing, insert nose geometry, insert wear, cutting feed and speed, heat-generated chip welding, and chatter.

Good finishes will result when you use the right combination of cutter geometry, insert style, and cutting speeds and feeds for the material being milled. It is also important to have the part adequately fixtured, and the machine properly maintained.

Figure 1 illustrates that finer finishes can be obtained by using a larger corner radius, flat, or wiper on the insert. This tends to wipe out or reduce feed marks. In addition to the corner geometry of the insert, it is important to correctly set each insert relative to the other inserts. For example, if all of the inserts have the same corner geometry, and are set in the cutter body to a face height of approximately .001" (0,025mm) relative to each other, the finish produced will be better than if the inserts were set to within .003" (0,07mm).

Improved finishes can also be obtained by increasing speeds and reducing feeds. Be aware, however, that increased speed also increases cutting temperatures, and may reduce insert edge life.

Finish will not necessarily be the same on all areas of the milled surface. Figure 2 shows that the Ra finish will be lower on the area where the feed marks are close to each other, and higher where feed marks are farther apart.

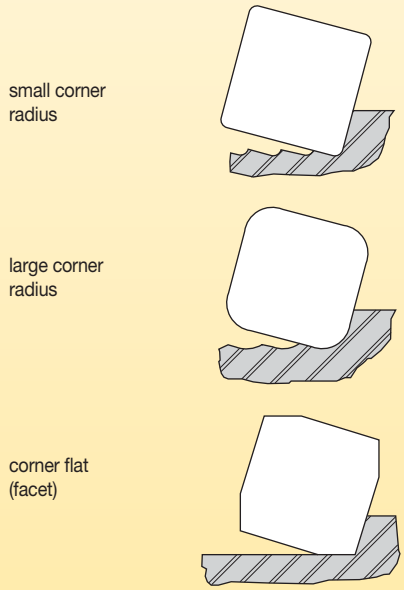

Figure 1: Larger insert corner radii or flats produce finer milling finishes.

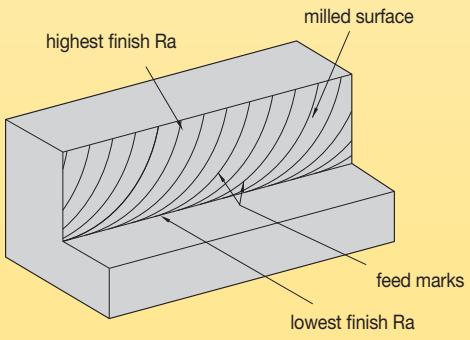

Figure 2: Quality of Ra finish corresponds to the distance between feed marks.

In figure 3, the Ra value will be lower near the outside diameter of the cut where the feed marks are at their closest, and higher at the center where the feed marks are farthest apart. Peaks produced are highest at the center of the cutter as it is positioned in the cut, and lowest at the outside diameter of the cutter, as illustrated below in figures 3 and 4.

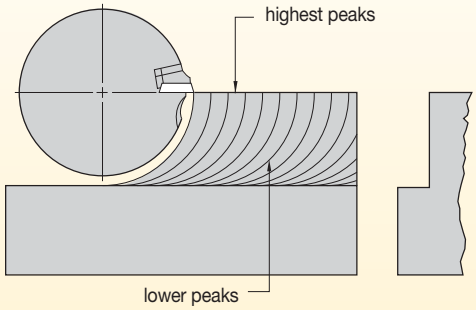

Figure 3: Ra finish is higher at the widest feed marks.

Both finish and flatness are affected by feed marks. A taper will be produced from the high peaks down to the low peaks.

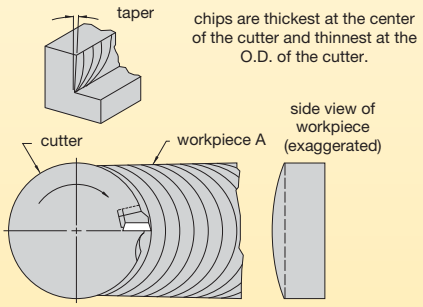

Figure 4: A taper is produced from the high peaks to the low ones.

Flatness also affects part tolerance. This effect is more predominant in side milling both sides of a part as shown in figure 5.

An obvious solution to obtaining a more consistent and improved surface finish with a minimum of taper is to reduce or flatten the peaks between feed marks. This can be done by introducing an insert with a corner configuration capable of wiping out or reducing these peaks. Shown in figure 5 is an exaggerated change in part width due to flatness and taper.

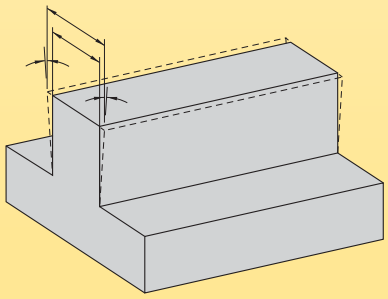

Figure 5: Flatness affects part tolerance more when milling both sides of a part.

(continued)

(continued)

Figures 6 and 7 compare the feed marks produced with a nose radius insert to those produced with a wiper insert. A wiper insert with a large radius for wiping out or reducing peaks (figure 7) has been effective in producing finishes below 3.2 (100) Ra. Figures 6 and 7 show the wiper insert is designed to "top off" the peaks of the feed marks. An improved surface finish, surface flatness, and reduced taper will result.

Wiper inserts are normally set at .001–.0015" (0,025–0,04mm) above the highest positioned insert in the cutter to ensure a good wiping action. Kennametal wiper inserts are typically designed to fit into any pocket in the cutter body. This means one or more wiper inserts can be used. Interchangeable wipers can be used to share the load on the periphery of the cut in feed per tooth.

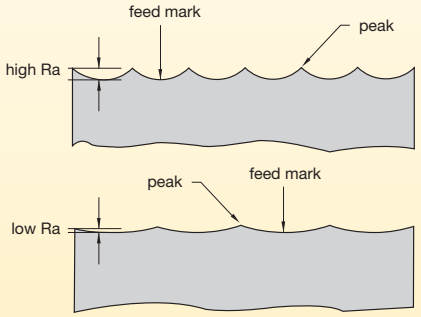

Figure 6: Peaks produced with a standard radii insert (top) compared to those produced with a large radius wiper insert (bottom).

Poor Surface Finish

cause	solution
cutter runout	Check for high insert, dirt in the pockets, or dirty spindle and cutter mounting face. Also, look for burrs on the cutter and damaged cutter pocket.
worn or chipped insert	Index insert.
feed per revolution exceeding flat on wiper	Reduce feed rate or install wiper with greater effective insert facet width.
wiper insert is set too high	Set the wiper insert .001–.0015" (0,025–0,04mm) above highest insert.
chatter	Check rigidity of machine and table fixturing. Check arbor and spindle, adjust feed rates, adjust RPM, or reduce cut width. Consider cutter with fewer pockets.

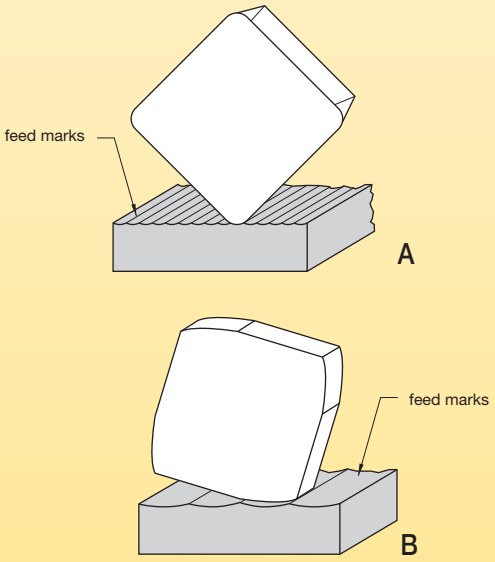

Figure 7: Feed marks produced with a nose radius insert (A) compared to marks produced with a wiper insert (B).

(continued)

(continued)

Measuring Finish Produced in a Milling Operation

Do not rely on your eye or fingernail to determine surface finish. Fingernails are about 25 times as thick as the stylus tip of a surface measuring instrument. They will skid across surface peaks, missing the valleys. Use a surface measuring instrument since the appearance of the surface finish may be deceiving. For example, reflected light on a uniformly milled surface pattern will look smoother than a random pattern. Also, a shiny surface will appear smoother than a dull surface.

Placement of the measuring device in a specific area on the milled surface will affect the reading. Also, a surface finish measured perpendicular to the feed direction is better than measuring parallel to the feed direction. This is usually the case regardless of workpiece condition and material (see figure 8).

Changing the cut-off width of the surface measuring instrument will affect the Ra value of the measurement.

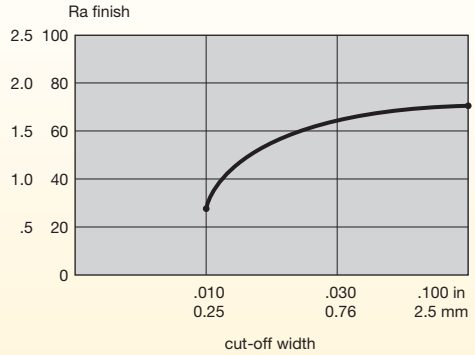

Figure 10: Finish quality is directly proportional to the cut-off width.

Surface Profile Record

Figure 9 shows the variation in roughness created by increasing the cut-off width on the instrument. The greater the cut-off, (see figure 9), the higher the Ra finish. For example, figure 10 illustrates that a .010" (0,25mm) cut-off width will produce a .6 (25) Ra finish; whereas, a .100" (0,76mm) cut-off width will produce a 2.0 (75) Ra finish.

Also, figure 10 demonstrates that most measuring devices are provided with .010" (0,25mm), .030" (0,76mm), and .100" (2,54mm) cut-offs. In most cases, the .030" (0,76mm) width cut-off is preferred.

Figure 11 shows the standard surface symbols specifying maximum and minimum roughness, waviness, and lay, which is the direction in which the measurement is taken.

Preferred Method

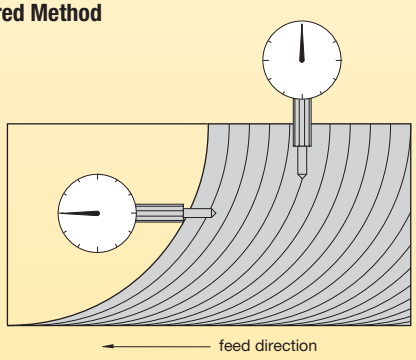

Figure 8: Measuring surface finish

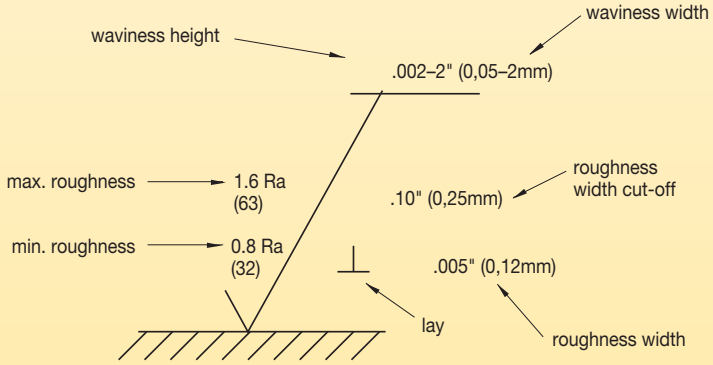

Figure 11: Standard surface symbols

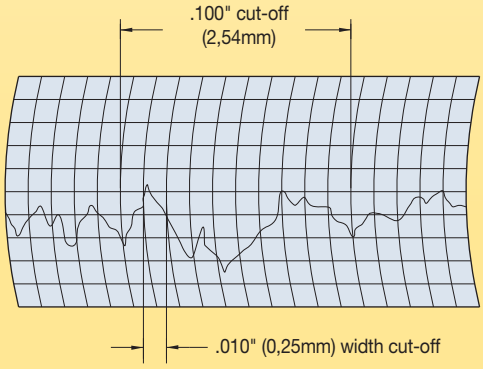

Figure 9: Increasing the cut-off width creates a variation in roughness.

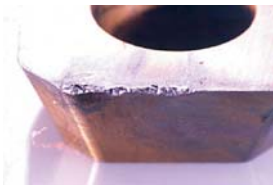
Troubleshooting Introduction

Troubleshooting should be performed in a sequential method to identify and solve your milling problems. These problems can be recognized as premature insert edge failure, part appearance, machine noise or vibration, and the cutter's appearance. Successful troubleshooting requires that we correctly identify the problem, then take the necessary corrective action one step at a time. The five key areas of concern are:

1. cutting tool material (grade)
2. cutter/adapter
3. machine
4. workpiece
5. set-up/fixturing

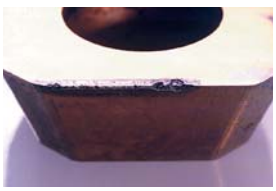
This section will discuss possible causes and will recommend corrective actions for each of the five areas listed. Remember, if more than one step is taken concurrently, the real cause of the problem may never be discovered. Always perform one corrective measure at a time.



Edge Condition Problems and Solutions

Chipping:

Appears like normal flank wear to the untrained eye. Actually, normal flank wear lands have a fine, smooth wear pattern, while a land formed by chipping has a saw-toothed, uneven surface. If chipping is not detected soon enough, it may be perceived as depth-of-cut notching.



Chipping can also be caused by recutting of chips. A good example of this would be a slotting operation where chip clearance or chip gullet space does not allow the chips to evacuate cleanly. In this instance, packing of the chips also occurs.

In most cases, by changing to a stronger grade and/or to a different edge preparation such as a larger hone or T-land, or from a 90° (0°) cutter geometry to a lead angle cutter geometry, will resolve the problem.

problem	cause	solution
chipping 	• chatter	• Check system rigidity for proper part clamping. • Correct worn gibs/bearings. • Check for improper cutter mounting.
	• edge prep	• Use largest hone or T-land possible.
	• grade	• Use a tougher grade.
	• built-up edge	• Increase speed.
	• feed	• Reduce feed per tooth.
	• recutting chips	• Choose cutter geometry with correct pitch for chip clearance. • Use air blast or coolant to remove chips.

Depth-of-cut notching:

Appears when chipping or localized wear at the depth-of-cut line on the rake face and flank of the insert occurs. Notching is primarily caused by the condition of the workpiece material. Material conditions prone to depth-of-cut notch include: an abrasive workpiece skin of scale, abrasive properties of high-temperature alloys like Inconel®, a work-hardened outer layer resulting from a previous machining operation, or heat-treated material above 55 HRC.

problem	cause	solution
depth-of-cut notching 	• cutter geometry	• Change to a lead angle cutter.
	• grade	• Use a more wear-resistant grade of carbide.
	• feed	• Reduce feed per tooth.
	• speed	• Reduce speed.
	• edge-prep	• Use honed or T-land inserts.
	• programming	• Vary depth of cut on very abrasive materials.

Thermal cracks:

These cracks run perpendicular to the insert's cutting edge and are caused by the extreme temperature variations involved in milling. In one revolution of a milling cutter, the insert starts to cut and the temperature quickly rises as the insert enters the cut. The varying chip thickness also changes the temperature throughout the cut. When the insert comes out of the cut, air or coolant flow rapidly cools the insert before it re-enters the cut.

These temperature variations create heat stresses in the insert which can result in thermal cracks. To the untrained eye, advanced thermal cracking could appear as chipping.

problem	cause	solution
thermal cracks 	• speed and feed	• Reduce cutting edge temperature by reducing the cutting speed and possibly the feed per tooth.
	• coolant	• Shut off coolant.
	• grade	• Use coated grade designed for wet milling.

Built-up edge:

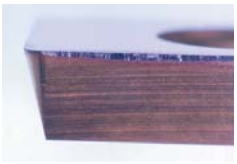
This condition involves the adhesion of layers of workpiece material to the top surface of the insert. Hardened pieces of the adhered material periodically break free, leaving an irregularly shaped depression along the cutting edge. This causes damage to the part and insert. Cutting forces also will be increased due to built-up edge.

problem	cause	solution
built-up edge 	• speed	• Increase SFM.
	• feed	• Increase feed per tooth.
	• coolant	• Use mist or flood coolant to avoid chips sticking to the insert when machining stainless steel and aluminum alloys.
	• grade	• Use sharp edge PVD inserts.
		• Higher speeds require diamond-tipped inserts or diamond-coated inserts on certain non-ferrous alloys.
	• edge-prep	• Use sharp edge, positive rake PVD inserts, or polished inserts.

Crater wear:

A relatively smooth, regular depression is produced on the insert's rake face. Crater wear occurs in two ways:

1. Material adhering to the insert's top surface is dislodged, carrying away minute fragments of the top surface of the insert.
2. Frictional heat builds up from the flow of chips over the top surface of the insert. Eventually, this heat buildup softens the insert behind the cutting edge and removes minute particles of the insert until a crater forms.



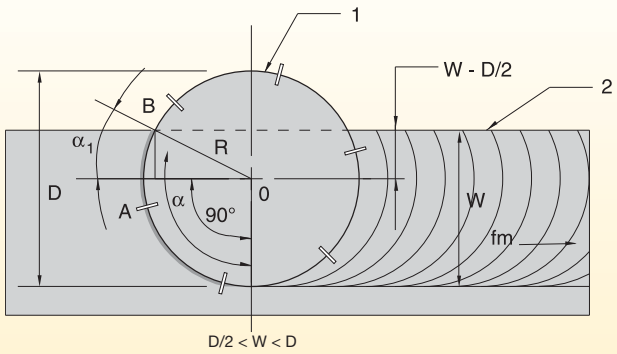
Crater wear is rarely encountered in milling, but can appear when machining certain steel and cast iron alloys. If crater wear becomes severe, there is a risk that the cutting edge will break, destroying the insert.

problem	cause	solution
crater wear 	• grade	• Use a more wear-resistant grade.
	• speed	• Reduce cutting speed.
	• edge-prep	• Use smaller T-land or increase feed to proper range for T-land.

Flank wear:

Uniform flank wear is the preferred method of insert failure because it can be predicted. Excessive flank wear increases cutting forces and contributes to poor surface finish. When wear occurs at an unacceptable rate or becomes unpredictable, the key elements that must be investigated are speed, feed, grade, and insert/cutter geometry.

NOTE: Inserts should be indexed for roughing applications when flank wear reaches .015–.020" (0,38–0,50mm). For finish applications, inserts should be indexed once flank wear reaches 0.01–0.015" (0,25–0,38mm), if not sooner.



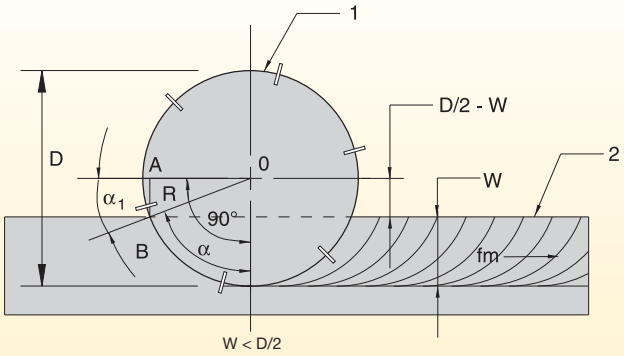
problem	cause	solution
flank wear 	• speed	• Check this area first. Recalculate SFM (Vc) to assure correctness. • Speed should be reduced without changing feed per tooth.
	• feed	• Increase feed per tooth (feed should be high enough to avoid the pure rubbing, which occurs with small chip thickness).
	• grade	• Use more wear-resistant grade. • Change to a coated grade if you are now using an uncoated grade.
	• insert geometry	• Inspect insert to determine if proper style is being used in the cutter.

Multiple factors:

When wear, chipping, thermal cracking, and breakage occur at once, the machine operator must look beyond the normal feed, speed, and depth-of-cut adjustments to find the root cause of the problem. Speed, feed, and depth-of-cut parameters should be re-examined for accuracy, but the system's rigidity should also be closely inspected for loose or worn parts as well.

problem	cause	solution
multiple factors 	• system rigidity	• Check system for loose cutter mounting. • Improve fixture and cutter rigidity. • Check for worn hardware or improper insert installation. • Reduce the gauge length of the cutter and arbor assembly.
	• feed	• Reduce feed rate to relieve cutting forces.
	• cutter geometry	• If possible, use a lead angle cutter to redirect cutting forces away from the insert nose.
	• insert/grade	• If possible, use a larger nose radius. • Use T-land insert. • Use a tougher grade of carbide.

Appendix • Engagement Angle and Number of Inserts in Cut



$$Z_c = \frac{Z \times \alpha^\circ}{360^\circ} \qquad \alpha = 90^\circ + \alpha_1$$

$$\sin \alpha_1 = \frac{AB}{OB} = \frac{W - D/2}{D/2} = \frac{2(W - D/2)}{D} = \frac{2W - D}{D};$$

$$\alpha_1 = \arcsin \frac{2W - D}{D};$$

$$Z_c = \frac{Z\left(90^\circ + \arcsin \frac{2W - D}{D}\right)}{360^\circ}$$

$$Z_c = \frac{Z \times \alpha^\circ}{360^\circ} \qquad \alpha = 90^\circ - \alpha_1$$

$$\sin \alpha_1 = \frac{AB}{OB} = \frac{D/2 - W}{D/2} = \frac{2(D/2 - W)}{D} = \frac{D - 2W}{D};$$

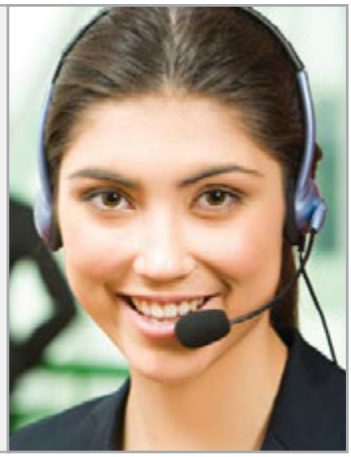
$$\alpha_1 = \arcsin \frac{D - 2W}{D}$$

$$Z_c = \frac{Z\left(90^\circ - \arcsin \frac{D - 2W}{D}\right)}{360^\circ}$$

D = cutter diameter
W = width of cut (woc)
α = engagement angle
α_1 = angle between cutter centerline and cutter radius to the peripheral point of exit or entry
Z = number of inserts in cutter
Z_c = number of inserts in cut

Service and Support

Customer Application Support (CAS)



Get Fast and Reliable Answers to Your Toughest Metalcutting Problems

Our Customer Application Support (CAS) Team is the metalworking industry's leading help desk resource for tooling application solutions and problem resolution.

Easy Access to Proven Metalworking Expertise!

Kennametal Customer Application Engineers assist customers and engineering groups throughout the world with expert tool selection and application recommendations for the entire range of Kennametal tooling.

SERVICE LEVEL EXCELLENCE	Fast telephone response. Quick technical solutions. Efficient case management.
SERVICES	Operating parameters. Process optimization. Hardware support. Tooling selection. Troubleshooting.
BEST-IN-CLASS SUPPORT TOOLS AND TECHNOLOGY	Materials database. Application calculators. Tooling performance experts.

Technical Information

*Recommended for wet machining only.

(continued)

NOTE: FIRST choice starting speeds are in **bold** type.
As the average chip thickness increases, the speed should be decreased.
